
$$f : g :: B - A : B + A$$

$$\text{from which } f = g \frac{B - A}{B + A}$$

which, substituted in place of g in Formula 1, gives the results as expressed in Formula 2.

In applying this to the case of hot water heating we have, instead of the descent and ascent of two solids of different weights, the descent and ascent of columns of water connected as shown in Fig. 3, the heated water rising in the branch A F and the cooler water descending in the branch B C. The force which produces the motion is the difference in weight of water in the two columns; the quantity moved is the sum of the weight of water in both columns. This is equal to the difference in weight of 1 cubic foot of the heated and cooled water divided by the sum, multiplied by the total height of water in the system, so that if W^1 represents the weight of 1 cubic foot in the column B C, and W represents the weight of 1 cubic foot in the column A F, and h represents the total height of the system, then the velocity of circulation will be in feet per second:

$$v = \sqrt{\frac{2gh(W^1 - W)}{(W^1 + W)}}$$

The formula, as given above, is somewhat more easy to calculate than that given by Hood and has the advantage of being more accurate, since the effect of the moving mass is considered. As an illustration, 1 cubic foot of water at 160° weighs 60.98 pounds, at 180° it weighs 60.55 pounds; the difference indicates the decrease in density and is 0.43 pound. The change of density is equal to 0.00702 per cent. expressed decimally. By the method first described the increased head causing motion, for a column 1 foot in height, would be 0.007 foot, and for 50 feet it would be 0.35 foot, which by the first theory would be the head producing the velocity, and hence the velocity would be equal to $8.03 \sqrt{0.35} = 4.77$, an amount which is one and three eighths that obtained by the more exact formula.

Computed by the exact formula already given, the velocity in feet per second for different heights and various differences of temperature will be as shown in the following table. The difference of temperature is estimated from 160°, although little sensible difference will be found for other temperatures.

Velocity in Feet Per Second in Hot Water Pipes.

* This is a well known fact stated in most works on mechanics.

Fig. 1.

Fig. 2.

Fig. 3.

Theoretical Velocity in Circulating Pipes.—Hot Water Heating.

that the velocity is produced by the head of water, equal to the difference in height of two columns of equal weight. The other case considers the mass of water moved, and practically the two cases give different results. The following illustration will make the method of computation clear:

Suppose a U-shaped piece of piping, with a cock at the bottom, is arranged as in Fig. 1, and filled with liquids of different density on either side of the cock. If the liquids on either side are of equal weight the lighter liquid will be higher than the heavier one. Thus, supposing that water is in one branch and oil in the other, and that it requires a column of oil 10 inches in height to balance one of water 9 inches in height, the difference in height of two columns of equal weight would be 1 inch. If, instead of having the height in each column equal, suppose enough water be added to the heavier column so that the bulk in each column be made equal, and if then the cock be opened the heavier liquid will move downward and shove the lighter liquid upward with a velocity which, neglecting weight

duce, the methods of which will be as follows: A body falling freely in the air would move at a rate of motion which is proportional to the square root of the distance fallen, and is in every case equal to the square root of twice the force of gravity expressed in feet per second multiplied by the square root of the height, or in the shape of a formula:

$$(1) v = \sqrt{2gh} = 8.03 \sqrt{h}$$

$$\text{since } \sqrt{2g} = 8.03.$$

This formula neglects entirely the resistance of the air, but it is very nearly true for heavy bodies falling in the air.

When, however, we have to consider the motion of other bodies, some upward and altogether of a greater mass of material than that moving downward, the velocity becomes quite different. In this case the force which produces the acceleration is to the force of gravity in same proportion as the difference of mass is to the mass moved. Thus, for illustration, take the simple case of two bodies connected by a cord which passes over a frictionless pulley, C, in Fig. 2. The heavier body B in its descent draws up the lighter body A. In this case the moving force is to the force of gravity as the difference in the weights is to the sum of the weights, and the velocity is the square root of

* This illustration is taken from Hood's work on "Warming and Ventilation," and shows the method generally adopted for computing velocity of motion.

New Surface Burning Florida Steam Boiler.

The American Boiler Company, 84 Lake street, Chicago, and 94 Centre street, New York, have just perfected and placed on the market a new and improved type of the surface burning Florida steam boiler, a general view of which is shown in Fig. 1. The special points to which the manufacturers call attention are as follows: 1. The heating surface has been greatly increased by deepening the corrugations in the sections. One of the features which have gained for the Florida its high reputation is its immense amount of heating surface, and in this respect a further improvement has thus been made. 2. A new and improved grate has been designed which will burn any kind of fuel, wood and anthracite or

soft coal burner by simply placing or removing the flue caps. For instance, by placing the caps on tops of flues a hard coal heater is obtained,

of soft coal be used, there is absolutely no danger of clogging. While this space in the old Florida was considered sufficiently large, the least possibility,

Fig. 2.—Broken View of Boiler.

with indirect draft; removing the caps, a soft coal heater is provided, with direct draft. 4. In this latest pat-

if there were any, of the passage becoming obstructed is removed by the enlargement of this chamber. 5. Another improved feature is secured by increased corrugated surfaces. The projections, as shown in the cut, Fig. 2, extending so far over the fire, by arresting the products of combustion in their course to the top of the heater, take from them a greater amount of heat than was possible in the old Florida; consequently when the gases reach the dome they are almost devoid of heat, so that there is absolutely no danger of the dome cracking by becoming overheated. 6. In certain sections of the country it is found cheaper and more convenient to burn hard coal part of the year and soft coal in other seasons. The interchangeable flues in this heater permit it to be easily adapted to such changing circumstances. 7. The new construction is more easily accessible for cleaning, having more clean out doors.

The Steam Fitters' Convention.

The Executive Committee of the Master Steam and Hot Water Fitters' Association of the United States give the following information in reference to the seventh annual convention, which will be held in Philadelphia on June 13 to 15, at the Continental Hotel. The rates will be from \$3 50 per day up, on the American plan. There will be ample room for all, but those wishing special accommodations should apply to Wm. P. Thompson, chairman Arrangement Committee, 112 Broad street, Philadelphia, at once.

All parties wishing to attend the Philadelphia convention can purchase at any railroad coupon ticket office, tickets on the certificate plan and at one and one-third fare rate for the round

The Surface Burning Florida Steam Boiler.—Fig. 1.—General View of Boiler.

bituminous coal, including pea coal. 3. The flues are interchangeable, one of them being a return, so that the heater can be converted into a hard coal or a

tern of the surface burning Florida the space between the top section and the dome has been greatly increased, so that, no matter if the poorest quality

trip; that is, full fare must be paid going, and a certificate obtained from the selling ticket agent, which, upon being signed by the national secretary at the convention, will entitle the purchaser to a return ticket at one-third the going price.

As there are several conventions to be held at Philadelphia at the same time, be sure and state, when you purchase your ticket, that you wish to attend the seventh annual convention of the Master Steam and Hot Water Fitters' Association at Philadelphia, June 10 to 15.

Delegates from all principal points west and northwest of Chicago to the convention of the Master Steam and Hot Water Fitters' Association and the National Association of Master Plumbers at Philadelphia in June, should be sure that their tickets to and from Chicago read via the Chicago, Milwaukee and St. Paul Railway, the only line running electric lighted, vestibuled trains between Omaha, Sioux City and Chicago, and between St. Paul, Minneapolis and Chicago, with compartment sleeping cars, standard sleeping cars, dining cars and most comfortable day coaches.

For further details apply to any coupon ticket agent, or address Geo. H. Heafford, general passenger agent, Chicago, Ill.

How Shall the Main be Run?

From S. F., *New Jersey*.—I submit to the readers of *The Metal Worker* a sketch, and will be glad to receive from

How Shall the Main be Run?

them some instruction as to what is the best method of running a hot water heating main from the boiler in the house to the stable shown. The cellar of the house in which the boiler sets is 7 feet deep, and the bottom of the cellar is 3 feet lower than the level of the stable, which is 100 feet distant. Two hundred square feet of radiation will be placed in the stable. The boiler stands 5½ feet high and the pipe must run at least 6 inches below the surface of the ground. I would like to know what would be the best size for the main in this case and the best way of protecting it from the cold in addition to the best means of getting the hot water over to the stable and a good circulation in this part of the system.

HEATING NOTES.

MANAGER MACKAY of the New York office of Hart & Crouse, 211 Water street, is fitting himself a very cosy office on the second floor of their building, which has become necessary through the increase in their steam and hot water business.

D. R. McCALLUM, manager of the New York house of the J. H. McLain Company, Canton, Ohio, who has had

an office at 69 Centre street, now occupies the entire showroom and is rearranging it, making some extensive improvements. An attraction to the steam fitting trade at the present time is the sample of the Cornell sectional steam boiler which has just been set up on the floor.

A NEW FIRM at Newport, R. I., are Lincoln Hammett & Co., 71 Mill street, who do steam and hot water heating, gas fitting, plumbing and electric lighting.

JOHN DAVIS, Second avenue and Eleventh street, Brooklyn, N. Y., the foundryman whose success in making heating boilers is well known, is enjoying a vacation among his old friends in England.

ARTHUR W. HILDERBRANT and OSCAR P. WARNER have formed a partnership and have embarked in the steam heating, plumbing and gas fitting business. The firm will be known as the American Heating Company, and will occupy the building on Church street, Hazleton, Pa. The company have the agency for the American boilers.

WALTER PENDLETON, manager of the New York office of the Niagara Radiator Company, Buffalo, N. Y., is showing a section of the new Niagara indirect radiator. The section exposes 16 square feet of heating surface. Their radiators will be used by the Hathaway Steam Heating Company, South Nor-

vester Company of Minneapolis, the final hearing in which was held last week before Judge Nelson, in the United States Circuit Court, at St. Paul, the decision was given that the Wood Company had the exclusive right to manufacture the well-known Appleby binder within the State of Minnesota. The case was referred to a master to ascertain the amount to be paid to the Wood Company for the violation of their rights by the Esterly Company and a permanent injunction was granted.

Central Stamping Company.

Central Stamping Company 23-25 Cliff street, New York, have for some time been engaged in a thorough overhauling of their manufacturing plants, warehouses and sample room. Extensive additions in the way of new buildings and machinery have been made at the different factories, dies examined and improved and a thorough system of betterments inaugurated. The effect of this renovation, we are told, will be seen by buyers from time to time in the enhanced appearance of many lines of goods with a view to making them even more attractive and merchantable than heretofore, at no increase in price as a rule.

In die work many plain surfaces have been embellished with raised or embossed figures, decorated utensils made in a variety of colors and finishes, so dealers may make a distinction in price on articles of uniform cost if desired, while inner surfaces on some goods which have been covered with solid color are now finished in more delicate and pleasing tints, with stripings of gold, &c., in some instances. The object of this wholesale renewal is to stimulate trade by producing goods of more tempting appearance for the same amount of money.

The president of the company, David James, has recently returned from a tour of some months in Europe, particularly through France and Austria, with a view to seeing what is being accomplished abroad in their lines of goods, and is incorporating many improvements in Sheet Metal Ware as a result of his observations. At both warehouses and factories they have installed independent electrical systems for furnishing power, light and heat. The sample room has been remodeled and lines of goods assembled in groups, which are designated by metal signs as follows: Farm, Dairy, Kitchen, House, Lawn, Garden, Stable, Insurance, &c., which are further subdivided under more specific names.

While the policy of the company is to ship direct from the different factories everything possible, they carry in stock in their New York warehouse an immense quantity of goods for the prompt execution of near by and hurry orders. There are eight floors in the New York building, including two basements. The top or sixth loft is reserved for such export business as cannot be attended to at the factories. The fifth loft contains largely specialties, the next below it seasonable goods, varying in character as the seasons change, while the third floor is stored with regular stock. The second floor contains the large display room, general and executive offices, city deliveries being made from the first or street floor. A number of new goods are being brought out, one of which is an improved Water Cooler Stand. Another specialty is a perforated Wrought Iron Garden Seat, to accommodate two or three people.

walk, Conn., in heating the new railroad station in that city.

FIRST VICE PRESIDENT JOHN B. DYER of the American Radiator Company, Chicago, is the guest of Treasurer Judson A. Goodrich at the New York office this week. They are displaying in their showroom a handsome photograph of the First Presbyterian Church in New York City, in which their radiators were used in the heating plant.

THOMAS W. WEATHERED sailed for England this week on the steamer "Berlin." The house of Thomas Weathered's Sons, 141 Centre street, New York, has been awarded the contract for the erection and heating of a large range of greenhouses and conservatories at Schenley Park, Pittsburgh, the amount of the contract being \$35,000.

GEORGE COPPINS, secretary of the Walworth Mfg. Company, Boston, Mass., has engaged passage on the steamer "Fulda" for a trip abroad.

In the case of the Walter A. Wood Harvester Company of St. Paul, Minn., against the Minneapolis Esterly Har-

TIN PLATES.

Tin Plate Manufacture on the European Continent.

At the request of a firm of consulting engineers, at Pittsburgh, the State Department have collected from Consular representatives of the United States some interesting information regarding the manufacture of tin plates and black sheets for tinning in Austria, Belgium, France, Germany, Great Britain and Russia, which are printed in the May issue of the "Consular Reports." The reports are not of very recent date, some being over ten months old, and they do not include any information about the new tin plate works which have been established in Italy and Spain. Nevertheless they embrace some information of interest, which has not hitherto appeared in the public prints, respecting the condition of the industry on the European Continent, and which deserves some measure of attention. We therefore print below an abstract of these reports, with excerpts therefrom, omitting, however, details regarding works in Great Britain, the general features of which are familiar to the majority of the readers of *The Metal Worker*:

Austria.

Consul General Max Judd, at Vienna, states that a fine quality of tin plate is manufactured in Austria for special purposes. The high cost of its manufacture, however, even with a heavy protective tariff, makes it difficult for the Austrian manufacturers to compete with England. Roughly estimated, the total cost of producing 100 kg. (220 pounds) of Austrian tin plate, exclusive of the cost of the iron, is given as follows:

Description.	Cost.
Rolling:	
150 kg. (330.69 pounds) coal.....	\$0.349
Fat.....	.067
Labor.....	.414
Total.....	\$0.86

Cleaning and heating:

Coal, sulphuric acid, fat and percentage of cost on use of boxes, &c.....	\$0.556
Labor.....	.146
Total.....	\$0.702

Tinning:

Fat.....	\$0.244
Coal.....	.045
Sulphuric acid, oil, &c.....	.069
Wooden box.....	.308
Tin.....	2.436
Total.....	\$3.102
Total for producing 100 kg. (220.46 pounds) of first, second and third class tin, exclusive of ore.....	\$4.664

Tin plate is not much used at present in Austria for roofing purposes, as zinc, on account of its greater durability, is preferred. It is used most extensively in packing food, matches, &c., and for the various articles made by the tinner. Mr. Judd states that the tin plate produced in the Austrian factories is considered by competent judges to be superior to the English, and even to the German. It is the extreme cheapness of the English tin plate that makes its export from England to Austria possible. No list of the Austrian works is given.

Belgium.

Consul Nicholas Smith, at Liège, reports that neither tin plate nor sheets of

iron or steel for tinning are now produced in Belgium. Though once a flourishing trade, it has been completely crushed by the new and larger enterprises. His remarks, in passing, that when its ruin was first threatened an effort was made by the Government to stay it by laying a heavy impost upon the foreign product. But as the decadence continued the duty was repealed and the industry left to die. In his judgment tin plate is being rapidly supplanted in the mechanic arts by other and better materials. If the Liège market may be accepted as a standard, very few uses now remain to it in Belgium. It is no longer employed for roofing and gutting; enameled iron has superseded it in the manufacture of household and kitchen utensils. Grocers' and confectioners' boxes are all of wood or paper. Canning is practically unknown; it is even said that fruit is sold to England in crates and bought back in porcelain. Vegetables from France alone come in tin, and even for this purpose it is giving place to glass. Belgium ceased to manufacture tin plate in 1875, when the English manufacturers enlarged their scale of production and the Belgian makers failed to keep abreast of their advance in methods.

France.

According to Consul-General Samuel E. Morse, at Paris, several important iron and steel works in France are engaged in the manufacture of tin plate, and the industry is a considerable one. Both iron and steel sheets are used. The following list of these works is appended to this report:

District of Paris.—Société Anonyme des Forges et Fonderies, Montataire, Department of the Oise.

Eastern District.—De Pruines, at Sémouse, near Plombières les-Bains, Department of the Vosges; Société Anonyme des Forges de Franche-Comté, Beaumont, Department of Doubs; Chavane Frères, Baing., Department of Vosges; the Estate of R. de Bruyer, Aillevillers, Department of the Haute-Saône.

Western District.—Forges d'Hanneboub, Department of Morbihan; Langlois, Léon et Cie., Base Indre, Loire Inférieure.

Central District.—Campoinnet et Cie., Guégon, Department of Saône et Loire.

Bohemia.

Consul J. C. Monaghan, at Chemnitz, reports that at Zuckmantel, a suburb of Teplitz, in Bohemia, is a works where tin plate is manufactured by what is described as a new, successful, simple and very profitable method. It is situated near a coal mine, the iron and steel bars and pig tin being brought to the works, the former from neighboring furnaces and the latter from abroad, although tin has been mined for ages in the hills of Bohemia. Machinery is made to do the work of men at every possible point in the process of rolling, dipping, handling and cleaning the plates, two men only being stationed at each tinning pot. The works run day and night, employing about

700 hands. They turned out in 1892, during every 24 hours, about 66,138 pounds of sheet tin. On the large rolls, where the ingot goes in the first time, after being taken from the furnace, are 14 men, four of whom get from \$1.60 to \$2 a day; others get \$1 and \$1.20. The average laborer receives 60 cents a day; day laborers (common laborers), 40 cents a day; mechanics, 75 cents to \$1; boys and girls, from 25 to 40 cents a day. Most of the help are paid according to what they make. The cost of living in Bohemia is very small, the necessities of life costing from one-half to one-quarter of what they do in the United States. The tin plate is put to all kinds of purposes from the smallest articles of domestic use to heavy roofing. A considerable quantity of the tin plate made at Teplitz is taken by the Austrian Government.

The size of the tinned sheets varies and depends upon distance of transportation, uses, &c. The prices are based on weight, with the kilogram (2.2 pounds) as unit. Of course, thickness counts as a factor; 1 sq. m. of iron tin plate 1 mm. thick weighs 7.5 kg. (16.5 pounds); 2 mm. thick, 15 kg. (33 pounds); 1 sq. m. of steel tin plate 1 mm. thick weighs 7.9 kg. (17.4 pounds); 2 mm. thick, 15.8 kg. (36.8 pounds). The average prices here, for 100 kg. (220 pounds) of iron tin plate, 22 marks (\$5.23); 100 kg. of steel tin plate, 38 marks (\$9). Thus a plate 2 mm. (0.078 inch) thick, 1 m. (39.37 inches) wide, and 2 m. (78.74 inches) long costs 6.95 marks (\$1.65.) The prices, however, fluctuate with the prices of the raw materials, and these, of course, depend on the supply and demand; oftentimes, on speculation.

Germany.

Consul-General Frank H. Mason, at Frankfort, gives the following details respecting the tin plate industry of Germany and the process of manufacture followed in that country: Tin plate (*Weissblech*) is manufactured in Germany by six firms, five of which are united in a trust or syndicate called the *Weissblech Verkaufs-Comptoir*, whose central office is at Cologne. The approximate annual product of these six manufacturers is as follows, the figures given being in boxes containing an average of 60 kg. (132 pounds). The five firms first named in the subjoined list belong to the syndicate above mentioned; the sixth has thus far operated independently.

	Boxes.
Rasselstolner Eisenwerks-Gesellschaft, near Neuwid.	180,000
Westfälischer Union, Nachroth, Westphalia.	120,000
Hütener Gewerkschaft, at Hütten, Westphalia.	90,000
Gewerkschaft Grillo, Funke & Co., at Schalke.	60,000
Les Petits-Fils de F. de Wendel, Haguenau, Lorraine.	40,000
Dillinger Hüttenwerke, Dillingen on the Saar.	60,000
Total.....	550,000

This is equal to 3300 metric tons, and is nearly all consumed in Germany, besides which Germany imports largely from England, the imports of tin plate in 1892 having aggregated 4378.6 metric tons, and those of 1893, 4614.8

tons. British tin is used mostly at and near the seaports of Germany, while the domestic product is consumed in the interior. The entire process of manufacturing and coating tin plate is performed in Germany by the makers above named. Nearly all the steel plate used for this purpose is made and coated in the same establishments. The tin used is, first, the 150 tons which are produced annually at Altenberg, in the Saxon Erzgebirge, and the remainder is imported mainly from Banca and Australia. Official statistics show that of the 10,537.6 tons of block tin imported into Germany during 1893, 5506 tons came from Great Britain and the British colonies, 3097 tons from Holland, 1194 tons from the Dutch East Indies, and the remainder from Belgium and Austria-Hungary.

All sheets used for tin plate in Germany are of mild steel (*Fluss-eisen*). The bars are rolled from four to six times, having first been heated to a dark cherry red. After this rolling they are called plates (*Blätter*) and are then reheated to a dark red heat and again rolled from five to eight times, the sheet being doubled each time when it has passed the rolls. The package of sheets thus rolled together is then sheared to the required size and the sheets pulled apart. They are then ready for cleaning and coating.

At the rolling mills two daily shifts of ten hours each are employed. The cleaning and coating departments work only one daily shift of ten hours. A plant which turns out during the year, say, 120,000 boxes, or 8000 tons, of tin plate employs about 480 men, boys and girls, whose average wages are 3.25 marks (78 cents) per shift. These operatives are distributed as follows: Rolling and shears, five men at \$1.90, \$1.54, \$1.19 and 47 cents; acid dipping, two men at 83 cents; annealing, three men at 83 cents, three boys at 47 cents and three girls at 34.7 cents; dressing (cold rolling), five boys and five girls at 34 cents; coating, six men, viz., two at \$1.42, two at \$1.19 and two at 71 cents; packing, four men at \$1.19 per shift.

After leaving the rolling mill the sheets are passed through two baths. The acid used in both baths is mostly crude hydrochloric (muriatic) acid, which is purchased at a strength of 20 to 22 B $\acute{e}$, and is diluted for the first bath with 4 or 5 parts of water, and for the second bath with 2 parts water to 1 part of acid. Sulphuric acid is considerably more costly in Germany than muriatic acid, and is for that reason rarely used for cleaning tin plate. All acids used for this purpose must be quite free from arsenic or the process is spoiled. After passing through the first bath the sheets are washed clean with water and are then dried and annealed. When entirely cool they are passed from twice to four times through the rolls (cold rolled) and again annealed. They are then passed through the second bath, washed clean with water and are ready for coating with tin. For each set of plates two kettles or cauldrons of tin are employed. The coating process varies slightly at the different works, but these differences are only in minor details and are too technical to be described here. To those who are interested in the subject all the different methods of coating employed in Germany will be found fully described in "Die Technik der Weissblech-Fabrikation," by Wilhelm Stercker, published in Verhandlungen des Vereins zur Beförderung des Gewerbelebens, Berlin, 1887, Vols. VI and

VII. In all cases the tin bath is protected from oxidation by a film of palm oil floating on its surface. After coating the sheets are brushed and cleaned from adhering oil by rubbing with wheat bran and are then ready for assortment and packing. The cleaning process is performed entirely by hand, no machinery of any kind being used.

Russia.

In a report from Consul General Charles Jones, at St. Petersburg, that official states there is no sheet iron or steel manufactured in his consular district, and no sheets for the purposes of the tin plate industry are manufactured in the Russian Empire. Black sheets of that description are imported from Wales, and they are simply coated with tin in the Russian factories. Imported black sheets are subject to a duty of 64 copecks per pood (about 1 cent per pound in gold); tin plates pay a duty of 1 rubbie 70 copecks per pood (2½ cents per pound in gold). In the Ural Mountains, on the eastern border of European Russia, roofing sheets are largely manufactured of the regulation size of 1 x 2 arshines (2½ x 4½ feet). They are of excellent quality and cheap, and in former times were largely exported, but now the export of Russian sheet iron is very small, because good sheet iron is made in many other countries. An attempt is being made to introduce the manufacture of sheet iron for the purpose of the tin plate industry in St. Petersburg, and a factory has been in process of construction on Vassili Ostrov for the last two years, but the impression prevails that the experiment is destined to prove a failure.

Consul Rawicz, at Warsaw, reports that tin plates are made in Poland, but only of black sheets imported from England.

New York Branch of Merchant & Co., Incorporated.

Since the well known Philadelphia tin plate and metal house of Merchant & Co., incorporated, first established an agency in New York City they have been obliged to change its location no less than four times in order to meet the exigencies of their growing business. Quite recently they removed their quarters from 247 Pearl street to a commodious building at 245-247 Water street, formerly devoted to the same line of business and far more favorably situated in every way. Here the firm have established themselves in a five-story building, with 35 feet frontage and depth of 75 feet, where ample space is afforded for carrying a very large stock of goods. Advantages in the way of increased floor space and storage are accompanied by a considerable improvement in the matter of light and ventilation over the quarters previously occupied. On the ground floor, at the entrance, is located the shipping office and city department, the remainder of the space being devoted to the storage of heavy stock, such as galvanized and sheet iron, tin plate, solder, sheet copper, &c. The second floor in front has been handsomely fitted up with a suite of offices, including two general business offices and the private office of the manager. Here Charles H. Bolles, Jr., the courteous representative of Merchant & Co., is comfortably installed, and here he takes pleasure in receiving his friends in the trade. A long distance telephone, close to his desk, places him in

instant communication with headquarters in Philadelphia. Back of the offices, on the second floor, are stored a lighter class of goods, such as zinc, ventilators, &c., while the third floor is devoted to corrugated leader, wire, tinners' supplies and such articles. Surplus stocks are carried in the firm's Brooklyn warehouse at 584-586 Flushing avenue. Mr. Bolles states that he has already been able to note a marked increase in the amount of business secured since the transfer to their present quarters, which are situated in the very center of the metal quarter. The firm are carrying in their New York store a very large stock of their "Tandem" continuous roofing tin, for which there is said to be an ever increasing demand in this vicinity. Merchant's "Star" ventilators are also attracting much custom, and in the new store an ample supply of these articles are always kept on hand for prompt supply.

SCRAP.

THE IRONDALE STEEL & IRON COMPANY, Middletown, Ind., have made a slight increase in wages of the employees in their tin plate works.

WELSH TIN PLATE MAKERS appear to be buoying themselves up with the hope that the American manufacturers will not be able to permanently hold the trade they are now holding. They take the position that the initial orders have been taken by American works at a loss in order to create a connection, but that when orders are repeated the American makers will be obliged to raise prices in order to make a profit. How far this expectation will be realized remains to be seen. It is, however, a matter of considerable doubt whether any of the tin plate manufacturers in this country are acting on this principle. So far as we have been able to discover they are proceeding on the sensible principle of contenting themselves with a moderate profit. Few, if any, we believe, are at the present time selling their plates at a loss. The hope on the part of the Welsh makers that they will ultimately be enabled to gain any large proportion of their lost American trade on these grounds is likely to prove a delusive one. American plates are gradually but surely establishing their reputation in this market, and a number of the largest consumers of bright plates have openly declared their preference for the American product as being more reliable and, on the whole, of a better quality than the imported article.

THE NEW ROLLING MILLS which the Stickney Iron Company are building at Canton, Baltimore, Md., will have an estimated annual capacity of 3400 tons of black plates suitable for tinning. A tinning department is also being added, and the new plant is expected to be in operation by about July 1.

THE Iron and Steel Trades Journal states that the situation in the Welsh tin plate trade is a very perplexing one. Of the few makers who are working the majority find their powers curtailed by their men being under the Board of Control and bound to work only two out of three mills. This, it is claimed, absolutely precludes any maker from showing a profit at present, as his standing charges on the idle part of his works consume any profit he might make on the active portion.

WARREN WEBSTER & Co., Camden, N. J., have recently supplied a 3000

horse-power Webster Vacuum feed water heater and purifier to the Pennsylvania Tin Plate Company, New Kensington, Pa.

ACCORDING to the returns of the British Board of Trade for April, exports of tin and terne plates from Great Britain to the United States during that month were 15,946 tons, as compared with 13,210 tons in the corresponding month of 1894 and 18,743 tons in March, 1895. The total shipments to the United States for the first four months of the year have aggregated 76,516 tons. The American shipments have been declining month by month during the present year, and it is thought probable that the gradual decrease will continue during the coming months as the production of American plates increases.

THE WORKS of the Landore Tin Plate Company, Swansea, Wales, recommenced operations last week at a reduction of 12½ per cent. in the wages of the workmen and on the understanding that a month's notice would be given by either party to alter the terms of the agreement.

THE CHEAPNESS of tin plate and the facility with which it can be molded by machinery to any required shape is leading to its substitution in England for tin foil and other papers for wrapping purposes. "Vulcan," in the London *Ironmonger* chronicles the fact that quite recently English tobacco manufacturers have taken to discarding the lead and silver paper wrappers for small square tin boxes, in which the better kinds of packed tobacco are now sold. The cases, which are neatly made and embellished with a device in enamel, hold one ounce of tobacco each. An extensive plant and machinery for the manufacture of these cases has lately been erected near Birmingham, and the trade is said to be a growing one. The wholesale price of the 1-ounce tobacco boxes is said to be no more than \$1.10 per gross.

THE PLANT of the Struthers Iron & Steel Company, manufacturers of sheet iron and sheet steel, Struthers, Ohio, is expected to be in operation not later than June 15 next. It will be remembered that the above firm purchased some time ago the plant of Summers Brothers at Struthers, Ohio, and since acquiring possession have equipped the plant with the most improved machinery to be had, and will soon be prepared to furnish the trade iron or steel sheets of any quality or size. J. Warner, who for ten years was connected with the Falcon Iron & Nail Company, Niles, Ohio, is general manager and treasurer of the Struthers Iron & Steel Company.

IN THE COURSE of CONVERSATION a member of one of the largest oil importing houses in the United States observed recently that the American tin plate makers are hardly alive as yet to the desirability of using only the very best African palm oil in the manufacture of tin plates, although this fact has long been appreciated by makers in Wales. The latter he said, habitually use only the highest quality of cleaned and clarified palm oil in their tinning pots. The dirt and grit which are always present in the cheaper grades of palm oil are an unmitigated nuisance in the pots, involving constant attention to the skimming of the surface in order to keep it clean, and thereby wasting time and material, as a small proportion of oil is unavoidably brought away at each skimming. Moreover, the dirt is paid

for in the weight of the cask, and this item represents several pounds weight in casks of cheap palm oil. There is, too, always the danger of scratching the surface of the finished plates when gritty oil is used. When American manufacturers have the full light of knowledge and experience in this matter, our authority remarked, there will be no more demand for the cheap brands of palm oil for tinning purposes in this country.

CABLE ADVICES from England state that several Welsh tin plate works are restarting this week, owing to the workmen accepting reduced wages.

ACTING SECRETARY WIKE has made an important decision regarding the allowance of drawback on pig tin. In a letter to the Collector of Customs at San Francisco he says: "The Department is in receipt of your letter in relation to the application of the Alaska Packers' Association for an allowance of drawback on imported pig tin entering with domestic lead into solder used in the manufacture of tin cans exported with salmon. As it appears that the quantity of tin contained in the solder so used can be ascertained by an examination of the finished cans, you are hereby authorized to allow on the exportation of the cans a drawback equal in amount to the duty paid on the pig tin used in soldering the same, less the legal deduction of 1 per centum. The quantity of the imported pig tin so used may be determined by allowing ½ pound thereof for each case containing not less than 48 cans."

A RECENT letter from San Francisco states that the prospects of the tin plate market on the Pacific Coast are very good. The outlook for the canning of fruits and vegetables and of salmon becomes better every day, and prices keep up. The outlook is for an unusually heavy consumption this year, and as the market is very lightly stocked supplies for a long time to come will have to be large. Imports by rail continue, but have ceased to be of any special magnitude. Imports to date by sea have been 151,479 boxes. The "Alamedas" has come to hand with 1084 ingots of Australian tin, making a total of 9051 ingots since January 1. There has been no special change in this market of late. Since the beginning of the year it has fluctuated between 14½ cents and 15 cents.

Ventilation and Heating.

The following paper was read by Dr. Mark T. Clay, Union City, Mich., before the Sanitary Convention held in that city:

Ventilation involves two ideas; one, the supply of fresh air, and the other the removal of the vitiated air. Accordingly two openings should be considered. If an open fire place exist in the room, it, in connection with some opening to admit fresh air, would in all probability be satisfactory. Fresh air may also be introduced into dwellings by mechanical means—namely, by the so-called impulsors. The pure air is derived somewhere near the house and conveyed to the ventilator, which diffuses it through canals into every corner of a room. The impure air escapes through fissures in windows, doors, walls and ceilings. And if, in connection, a corresponding system of suction canals be arranged, the effect is the greater, and the division of air is under

complete control. The dust may be carried away with vitiated air. The circulation of air is effected by the fresh air entering at the top of the room and sinking downward, while the impure air, together with any falling dust, is sucked out at the bottom of the room. More thought is given to the subject of ventilation during the fall and early winter than any other time of the year. In the summer time windows and doors are wide open and the air circulates freely through the houses, stores, offices and all other inclosures, but with the first coming of cold weather down go the windows and slam go the doors, and the people immediately begin to suffer from drowsiness, nausea, headache, faintness, and all the other ills that attend the breathing of impure air. This brief season between summer and winter is the most trying period of the whole year, and is much worse than the corresponding time in the spring, for by the latter time people have become used to breathing foul air, and then artificial heat is continued till summer heat arrives, and so makes it possible to open windows in the intermediate time of cool weather.

But in the fall all this is different, for heat from furnaces, stoves and boilers is economized till the last moment, and in the meantime every cool air entrance is kept sealed lest some one suffer from a chilly draft.

When winter arrives the conditions become changed. The furnaces and indirect radiators deliver large volumes of fresh air into the rooms, and where the direct heating systems are employed the plentiful supply of heat makes window and door ventilation possible without discomfort. The breath of life in a physical sense is pure air, and of this there must be plenty. Home ought to furnish the restorative agencies, for the place of toll or business cannot always be of a health giving character. Toll, of whatever character, is exhaustive of life's forces. But in our homes, where a part of the day and all the night is spent, very little attention is paid to their construction in regard to ventilation. Doors and windows, with an occasional transom, have been deemed sufficient. That fresh air in plenty may be had requires a more careful arrangement. The old fashioned house, with its open fire place in every room, was a more practicable provision. And this reference suggests the only specific recommendation we care to make—namely, every dwelling of more than one story in height ought to have a ventilating shaft or chimney, into a separate compartment of which every room should have an opening. The construction and connections of such ventilating shafts need not increase the cost very much, if the plan were properly made; and in cases of sickness this additional facility in the sick room would often make the difference between continued illness and recovery.

The New York *Journal of Commerce* announces that a number of export houses interested in the South American trade are developing a new scheme for the organization of an intercontinental express company which will facilitate the export of merchandise to Central and South American countries.

A dispatch from Mexico announces that the Tehuantepec Railroad is now in operation, and that there is considerable passenger traffic on it.

STOVE TRADE NOTES.

Furnace and Range Association.

About two years ago the members of the furnace and range trade of New York City and vicinity quietly organized under the somewhat imposing title of the "Furnace and Range Dealers' and Manufacturers' Association of the City of New York and Vicinity," for the excellent purpose of fostering good will among their members and drawing them into closer friendly relations. With a view to making the organization more effective in case joint action should be required in the matter of labor or other possible complications, the association affiliated with the Builders' League of New York, but the consolidation was only incidental to the more important purpose of establishing and maintaining pleasant social relations between its members. The association held its annual meeting last Wednesday afternoon and, having discussed matters of mutual interest, elected for the ensuing year the following officers:

President, D. S. Ramsay.

Vice-President, C. B. Boynton.

Secretary and Treasurer, W. M. Seymour.

These officers, together with C. O. Lyon, George G. Brooks and D. U. Cory, constitute the Executive Committee.

After the meeting the members adjourned to Mouquin's restaurant on Fulton street, where they sat down to enjoy an elaborate and delicious dinner, the following members taking part in the feast and in the oratory that began with the coffee: D. S. Ramsay of Ely & Ramsay, Charles C. Lincoln of J. D. & C. C. Lincoln, James G. Lyon, Chas. B. Boynton, E. E. Dickinson and J. Wodell of the Boynton Furnace Company, Charles O. Lyon and Edward Benedict of the Thatcher Furnace Company, H. E. Jones of Jones & Kirtland, William M. Seymour of Graft & Co., Henry Morford and Thomas P. Rushby of the J. L. Mott Iron Works, E. C. Moffatt of the Simonds Mfg. Company, D. U. Cory of Uzal Cory & Co. and George G. Brooks of Bramhall, Deane & Co. While this does not include the entire membership, which embraces several other prominent firms in the range and furnace business, it constituted a happy family of kindred spirits, who, in the pleasant intercourse of the evening, gave no evidence of being business rivals. The dinner was a perfect success, and when President Ramsay spoke to a cigar accompaniment

he addressed a well fed and genial audience, ready to applaud his witty observations and heartily assent to his deprecation of whatever promoted suicidal competition. All of the members present were introduced in turn, and each gave expression to his belief in the benefits to accrue from the cultivation of a friendly spirit in their business relations. The speeches were not of the extemporaneous, carefully memorized sort, for none knew beforehand that he was to be called upon, and the general good fellowship which characterized them was, therefore, a true expression of the prevailing feeling.

There is every reason to believe that this organization will continue to grow in efficiency and strength, for the idea underlying it is a most excellent one, and it is to be hoped that its influence will spread throughout the State and lead to the formation of kindred associations in many places.

The Ohio Stove Trade.

Advices from stove manufacturers in this section continue to be encouraging. A number of founders have taken special care to send us information taken from their books which shows the volume of business thus far transacted during the year 1895 to be greater by 25 to 32 per cent. than last year, and in some instances this is especially gratifying, as the business transacted in 1894 was the best ever experienced. Those who have anticipated a falling off in business during April have been surprised by increasing orders.

Most of the foundries near Cincinnati are running full in every department, with the outlook favorable for continued activity. Some manufacturers even write that they have need to increase present capacity, but that they cannot do so now without interfering with present business. Information from some sections of Indiana, however, indicates that trade is falling off some there. Business during the first three months was heavy; in fact, including April, greater than any preceding year, but the past month has shown a quieter tendency, as is to be expected at this season.

The restlessness in the labor field seems to be the only disturbing feature at the moment, and even that is likely to be settled by arbitration, although the tendency seems to be toward an increase in the cost of production, as iron is advancing, with the prospect of a further rise in both the North and South, but the hardening tendency has caused a lull in the market for pig iron.

Money is in more ample supply and

rates of interest have been less firm during the past week.

New England Stove Manufacturers' Association.

The New England Stove Manufacturers' Association held its annual meeting and banquet at the American House, Boston, Thursday evening, May 16. The dinner was preceded by a business meeting at which the following officers were elected:

President, A. W. Walker.

Vice president, John R. Prescott.

Secretary and treasurer, P. W. Elliott.

Executive Committee:

W. A. Spicer.

W. E. Walker.

G. L. Walker.

Price Committee:

J. R. Prescott.

A. N. Parlin.

C. F. Baker.

W. P. Hood.

R. E. Warner.

At 7 o'clock the company, members and guests, adjourned to the banquet hall, where covers were laid for 80. The table was handsomely set and decorated and furnished with a dinner of exceptional excellence. The menu, which was full of word play on the names and characteristics of the various goods manufactured in New England, was the source of much amusement for all present.

Following are the names of those who were present:

H. A. Tinkham, Geo. W. Elliott, L. B. West, Geo. C. Blandin, Geo. L. Walker, C. F. Baker, B. M. Shaw, E. W. Fiske, Frank E. Woodward, W. McK. Barbour, Richard E. Warner, John R. Prescott, P. W. Elliott, Albert N. Parlin, W. E. Walker, William A. Spicer, George W. Walker, George E. Wilbur, George W. Barrows, Arthur W. Walker, Daniel D. Dunkler, F. P. Leonard, F. K. Chase, Wallace C. Leonard.

At the close of the dinner President Wm. E. Walker called the company to order and introduced the speakers with grace and felicity. The after-dinner speeches were delightfully informal; in fact, the whole affair was a sort of family gathering in good old New England style, and every one appeared to enjoy it. The toast list was as follows:

1. Modern cooking as exemplified in the Culinet range. Geo. W. Walker of Walker & Pratt Mfg. Company, Boston.

2. On the recent introduction of ranges in Europe, especially at Monte

Carlo. Albert N. Parlin of Magee Furnace Company, Boston.

3. How I Got There at the World's Fair, or How the Model Line Came to be Awarded a First-Prize Medal at Chicago. Wm. A. Spicer of Spicer Stove Company, Providence, R. I.

4. What I Know About Pattern Making. Geo. E. Wilbur of Weir Stove Company, Taunton, Mass.

5. My Experience in the State Board of Arbitration. R. E. Warner of White, Warner & Co., Taunton, Mass.

At the close of the regular toast list the president-elect, A. W. Walker, was escorted to the chair and made a neat speech of acceptance and compliment to the retiring president. Mr. Walker in turn presented H. A. Tinkham and Geo. W. Elliott, who responded briefly and pleasantly.

Although this was the third annual meeting of the N. E. S. M. A. it was their first annual banquet. Much credit is due P. W. Elliott for his efforts to make the affair a success, in which he was ably assisted by the committee. The occasion was greatly enjoyed by all those present and marks a new departure in the New England trade which it is planned to keep up by frequent meetings, succeeded by dinners at which the speech making talent developed at this banquet may be further utilized and that which it is suspected is lying dormant brought out for the enjoyment and profit of the trade.

Death of Ex-Treasurer Peckham of the Stove Association.

The stove trade of the country will learn with deep regret of the sudden death of S. Townsend Peckham, which occurred at midnight on May 11. The funeral services were held at 5 o'clock of Tuesday, May 14, at his late residence, 137 West Seventy-sixth street, New York City, and the interment was at Forest Hill Cemetery, Utica, N. Y. Mr. Peckham was for a number of years treasurer of the National Association of Stove Manufacturers, retiring from the office in May, 1892.

HUGH R. CHAMBERS, manager of the Troy branch of the Phillips & Clark Stove Company, Geneva, N. Y., has recently been elected Grand Master of the State Orange Lodge. Mr. Chambers was employed by the Fuller & Warren Company from 1880 until 1883, when he entered the service of the Phillips & Clark Stove Company, going with the concern to Geneva in 1884. The next year he filled the office of traveling salesman, and since 1890 he has been the successful manager of the Troy branch of the company. In the year 1880 he was initiated in the Royal Orange Institution in Troy and made Master of the Abraham Lincoln Loyal Orange Lodge in 1884. Later he was Master of Mount Horeb District, L. O. L., composed of the officers of all the lodges in Troy and vicinity. He was elected First Deputy Grand Master of New York State in Syracuse in 1894 and was unanimously chosen this year for State Grand Master.

Quakertown Stove Works.

We have received from Roberts, Winner & Co., proprietors of the Quakertown Stove Works, Quakertown, Pa., a copy of the illustrated catalogue and price-list which they have issued, showing their lines of stoves, ranges, heaters and Alaska steel plate furnaces. It is a neat publication of 86 pages, bound in colored paper covers, with embossed title in old gold. The opening pages give the names of those composing the company, the address of the Philadelphia sales agency, an alphabetical index, as well as a brief announcement to the trade in which attention is called to a number of additions which have been made to the company's line of ranges and heating stoves. Our Leader range occupies the place of honor and is shown in a variety of styles and sizes. It embodies the modern features of utility and convenience and is shown in a very neat and attractive dress. The Beechwood range, for coal or wood, made in four sizes; the Paragon, a six-hole range, attractively treated, and the Triumph, a five-hole range, are some of the other goods to which the attention of the trade is invited. There is also the Electric, the Lstimer, the Artisan, the Queen Beechwood, the Belmont, the Tip Top, the Neptune, the Daisy and Lucerne ranges and the Invincible cook for coal or wood, all made in several styles and sizes. The latter portion of the catalogue is devoted to heaters, the Royal Princess, made in two sizes, being the first considered. Following this is the Menlo, double heater; the Glendon, a medium priced parlor stove; the Laurel, a direct draft heater; the Jeanette, Gypsy, Aldine, Red Hot, Fire King and St. Jo. The Alaska steel plate furnace occupies several pages, while others are devoted to classification of castings for repairs, prices of fire brick and skeleton cuts of the various stove plates, numbered for the purpose of facilitating the ordering of repairs.

The Specialty Furnace.

The latest candidate for prominence in the furnace line is the Specialty furnace, just brought out by the Thomas, Roberts, Stevenson Company, Philadelphia, Pa. It is said to embody some rather striking features in its make up, both externally and internally. The front is square in shape, massive, and unique in appearance. The upper portion of the front projects somewhat, so as to allow of plenty of room when admittance to the inner casing is required through the door arranged for that purpose. The door is in the form of an eye and is nickel plated. The eye is surrounded by a representation of flames, which work into the general design of the front. On each side of the fire door are flambeaux, and the details of the whole design seem to give the impression that the furnace and its scientific principles are "under the eye." The front fastenings are so designed as to make the task of mounting easy for one man only. The fire door is large and the nickeled name plate covers the greater portion of its surface. The coal chute is wide and large. Immediately under the fire door is what is described as an "oxygen conduit," which admits air to a belt or ring formed by the lower edge of the crab section and the upper edge of the fire pot. The air taken into this ring finds an outlet into the combustion chamber by the way of small slots in the edges

of the two sections and consequently increases the efficiency of the heater. The air belt also is said to cool the fire pot and relieve it from all tendency to crack. The grate is known as the Ransom Duplex, and is made to slide into position on ledges, so that it may be removed at any time. The grate and shaking apparatus are all held in place by a single pin and washer, so that instant removal of the whole may be effected without first removing bolts. There is an independent slip feeder neck front which bolts to the crab, and as the fire pot and crab expand the front also expands and slides up on the main front, leaving the main front in its original condition and preventing a disturbance of the construction of the furnace and consequent leakage. The front is said to be more durable on account of this device. A new form of check valve controls the draft. A damper on the inside of the valve is so connected with the valve itself that when the latter is opened the damper rises, resulting in a double check to the draft and preventing an inrush of air from the cellar, carrying the gases back to the combustion chamber. It also, it is claimed, renders the opening of the fire door entirely unnecessary, except for stoking. The vapor pan is galvanized. The castings are heavy and the drum is constructed of 16-gauge sheet iron or steel. The ash pit is in one piece, thus obviating the annoyance caused by ashes sifting out into the hot air chamber and their dust passing upward through the registers. The furnace is designed especially to burn pea coal, and is claimed to possess advantages in point of economy which should insure large sales. The makers state that combustion is so perfect and the furnace is under such complete control that 4 tons of pea coal will heat the Philadelphia seven or eight room house that ordinarily requires 6 tons of stove coal.

ODD PLATES.

THE FERROSTEEL COMPANY of Cleveland and Chagrin Falls, Ohio, are meeting with a good demand for their specialties and are said to be so crowded with orders that the works are running considerable overtime. The force is about to be augmented by the addition of 20 hands, which will raise the number of employees to 55.

THE PENINSULAR STOVE COMPANY of Detroit, Chicago and Buffalo are furnishing their customers with all kinds of stationery in the way of letter heads, bill heads, &c., having a very neat and attractive lithographed heading embodying the name and address of the customer and a *fac-simile* of the trade-mark of the company. This stationery is supplied at low prices, which enables the dealer to have a finely lithographed letter head for about the same price he would pay for a cheaply printed one. A circular which the company have issued shows the various sizes of stationery which can be supplied and the prices in lots of 500 and 1000.

THE WROUGHT IRON RANGE COMPANY of St. Louis, Mo., have rented a store at Freehold, N. J., and will introduce the Home Comfort range in that vicinity.

THE ROYAL RANGE is a new candidate for public favor on the sample floor of Hart & Crouse, 211 Water street, New York. Manager Mackay has rearranged his sample floor, grouping the various samples of radiators attractively in the center and setting the Royal

range on a platform on one side. The range is made both single and double oven, the single oven range being made to heat an upper room and with the oven at either the right or left of the fire. Both ranges are furnished with a duplex grate and sifter grate and a large ash pan. They are of the sheet flue character, and are provided with the Reed damper. Both styles are furnished with a low hot closet and a nickel plated kicker, which is placed beside the nickel plated oven shelf. This opens the door of the large ventilated oven. Both ranges have the reversible long center, and the double oven range has four cooking holes over the fire. A large nickel plated oven panel, bearing the word Royal, is placed on the oven door, and the ranges are provided with a warming shelf of very attractive design.

THE HAWLEY DOWN DRAFT FURNACE COMPANY have been incorporated in Jersey City by Thomas H. Williams, D. L. Bleyer and H. Woods for the purpose of manufacturing furnaces, the capital being \$30,000.

GRINBERG BROS., 154-155 South street, New York, are issuing a circular, printed in blue ink, of their Eagle gas range. The top, front and base of the range are made of cast iron and the body of sheet steel. A nickel panel bearing their trade-mark, an American eagle, is placed on both the oven and broiler doors. The top is made of fret work casting, with the cooking burners located beneath so that flat bottomed utensils of any size may be set over the flame. The oven is 15½ x 17 inches and 11 inches high. The broiler is located beneath the oven and powerful burners are placed in each to insure successful work. The range is made in a variety of styles, some having additional cooking burners on a step attachment at the side, others having two additional burners on the top, which are made also to heat the water back attachment.

ISAAC A. SHEPPARD & Co., Philadelphia, are putting on the market a new oak stove of ornate design, made in the usual sizes and designed to burn either coal or wood. The stove is massive in appearance, has an extra large door, with large nickeled name plate, nickeled fire pot ring, nickeled top and swing cover, nickeled foot rail of novel design, nickeled ash pit door, square base, heavy fire pot, and all cast iron body elaborately ornamented. The arrangement of the stove is such that the draft is said to be under perfect control. The stove is an addition to the makers' well-known line of heating stoves and will, no doubt, be appreciated by the trade.

THE EXCELSIOR MFG. COMPANY, St. Louis, Mo., report an excellent demand for their Charter Oak stoves and ranges. They have just received an order of liberal dimensions to be shipped to a point in France. This concern are working on a number of new goods, which will be ready for the trade very shortly.

ADVISES from Muncie, Ind., are to the effect that the Joseph Bell Stove & Range Company are now working a larger force than at any time since their removal to that place.

THE FAVORITE STOVE & RANGE COMPANY of Piqua, Ohio, are about enlarging their plant with a view to increasing their manufacturing facilities. The present pattern departments and the carpenter shop have been found inadequate,

and the foundations have been laid for a new structure 140 x 40 feet in size. This is located in the angle formed by the molding room and the finishing department annex erected since the original plant was built. The new structure will be fitted with all necessary machinery and will be occupied by the pattern makers, pattern filers and the carpenters making flasks and follow boards for the molders.

MATTHEW HALL, 1927-31 Market street, Philadelphia, is making a specialty of the Colonial Fortune range, with steel hot closet and cabinet, and of the Specialty hot air furnace, which he claims is a natural gas well, generating gas from pea coal, mixing it with atmospheric air, so that a large space in a building is heated with a small consumption of fuel.

THE BLACKMORE HEATING COMPANY, 101 Beekman street, New York, are distributing throughout the Eastern States a circular calling attention to the fact that they are the authorized sales agents for the Triumph line of warm air furnaces made by the Craig Reynolds Foundry Company of Dayton, Ohio. The large warehouse at 291 Pearl street, New York City, has been leased, where the Blackmore Heating Company will carry a full stock of furnaces, together with a complete supply of repairs.

THE MARCH-BROWNBACK STOVE COMPANY of Pottstown, Pa., are distributing circulars calling attention to the Crown warm air furnaces and the Art Franklin grate. The circulars are printed in colors and give a full account of the heaters named. Full directions are also given for setting the Art Franklin grate, the instructions being accompanied by sectional views showing the general scheme employed. The goods are made in numerous styles and sizes and the circulars which are being sent out cannot fail to interest architects and builders, as well as stove dealers generally.

THE CRAIG-REYNOLDS FOUNDRY COMPANY of Dayton, Ohio, have issued a catalogue of the Triumph warm air furnaces and combination heaters which is likely to interest all dealers. The pages are nearly square in size and carry broken and general views of the company's goods, together with ample descriptive particulars relative to construction and operation. The printing is in two colors and the binding is in neat covers. The frontispiece is a bird's-eye view of the main office at Dayton, Ohio, following which is a front elevation of the company's Western branch at 89 Lake street, Chicago. The principles of heating, methods of ventilation and the selection and construction of Triumph furnaces occupy other pages in the earlier portion of the volume. Various forms of the Triumph heater are then illustrated and described, accompanied by tables showing weights, measurements, capacities, &c., of the Triumph combination heater.

D. A. DANGLER, president of the Dangler Stove & Mfg. Company, will sail, June 8, on the Cunard Line steamer "Umbria" for a three months' trip abroad.

THE KERNAN FURNACE COMPANY of Utica, N. Y., are providing additional storage capacity in order to meet the demands of their largely increased business. We understand that when the improvements now under way are completed the company will have 16,000 square feet additional space.

THE MONARCH STOVE COMPANY of Mansfield, Ohio, have recently booked a large order for stoves from a concern in the United States of Colombia. It is reported that the company are building up an extensive trade in South American countries.

THE EXCELSIOR MFG. COMPANY of St. Louis, Mo., have issued a circular illustrating the Sylva and Rustic sheet iron heaters, made in one size each. The Sylva is intended for using hard or soft coal, while the Rustic is arranged for burning wood. The stoves have cast iron tops and bottoms, large door openings, double swinging doors with damper slides and bodies made of extra heavy cold rolled steel of smooth finish. Each stove, when shipped, has packed in it four joints of pipe, one elbow and a tin flange, enabling any one, the manufacturers state, to set up a stove and heat a good sized room in ten minutes.

THE VICTOR STOVE COMPANY of Salem, Ohio, resumed operations at their works on Monday morning of last week.

THE WROUGHT IRON RANGE COMPANY of St. Louis, Mo., have recently furnished the outfit for the galleys of the new American Line steamer "St. Louis." In doing this the company have spared no time nor expense to place in this ship the finest line of goods manufactured. In the main or first galley is a Home Comfort duplex six-oven range, nearly every portion of which was made from special patterns. There are also two portable bake ovens, two French charcoal broilers, two copper jacket kettles and a full equipment of cooking utensils. In the steerage galley is a Home Comfort 5-foot range with steam roasting oven and three 70-gallon jacket kettles. The first cabin pantry is fitted with a special design combination carving table and plate warmer, which is 34 feet long, weighs over 12,000 pounds and is heavily nickel plated. It was constructed from special designs, the top and bottom of the table being of cast iron made in one piece. The top is covered with pure block tin ½ inch thick. The doors of the plate warmer are so constructed that they slide under the top, leaving the front open. There is also a copper Bain Marie with 12 vessels, also a special battery of copper nickel plated urns, the design of which is unique and tasteful. In the officers' serving room is a hot table with plate warmer and nickel plated coffee urns. In the second cabin is a copper Bain Marie with five vessels and two specially constructed hot water vases, as well as an 11-foot hot table.

A report received from the Scientific Commission sent out some time ago by the Pan-American Investment Company of New York to investigate the coal and oil fields of the Republic of Colombia, states that large veins of anthracite coal have been discovered on the eastern banks of the Gulf of Uraba, in the district of Varlen. It is also reported that bituminous coal deposits at Punta Arboletes are being successfully operated by an American company. The oil fields of Colombia are now in progress of development, and many new wells have been found near the Caribbean Sea.

A London firm have been advertising in the English papers for a large number of galvanized iron huts for export to Brazil.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until June 11 for work including the roof and roof covering and drainage for the United States Post Office Building at Taunton, Mass. Plans and specifications can be obtained from the Supervising Architect at Washington or from the Superintendent at Taunton.

WHITEHEAD & LEWIS of Detroit have been awarded the contract for supplying the heating and ventilating apparatus for a new Government Building at Newark, N. J.

N. F. DRUMHELLER, Lansford, Pa., has the contract to heat the County Jail with steam. The heating apparatus at the Court House is to be remodeled also.

CREED & SMALL have been awarded the plumbing and heating contract for two of J. Thompson's houses on Wellington street, Montreal, Canada.

EX-ALDERMAN JOHN POWERS, Malden, Mass., has been awarded the contract for plumbing the new High School Building.

THE CONTRACT for the steam heating apparatus for the new County Clerk's office at Mexico, N. Y., was awarded to John C. Sullivan of Oswego, for \$1453.

WILEY & CALHOUN of Portland, Maine, have the contract to place a very elaborate system of heating and plumbing in the residence of W. S. Nash, at Redstone, N. H.

THE IOWA BROS. PLUMBING COMPANY, Ft. Madison, Iowa, have been awarded the contract of plumbing the handsome new Cattermole residence, corner of Fourth and Chestnut streets.

THE CONTRACT for heating the new Odd Fellows' Building has been awarded to the Barlow Brothers Company, Waterbury, Conn.

THE JENIVSON PLUMBING COMPANY, Fitchburg, Mass., have just taken the contract to equip the new factory of the G. A. Gane Shirt Company, Leominster, with automatic sprinklers.

SAMUEL I. POPE & Co. of Chicago were the lowest bidders on the contract for constructing the steam heating and ventilating plant for the Federal Building at Worcester, Mass. Their bid was \$7590, and they agree to finish the work in 90 days.

THE NORMAL SCHOOL BUILDING at River Falls, Wis., is to have a new heating system.

THE RINGEN STOVE COMPANY, St. Louis, have been given the award for heating the Harrison School, including the Hyatt & Smith heating and ventilating and the Powers regulating system.

THE BENNETT & WRIGHT COMPANY, Toronto, Canada, are doing more figuring on contracts just now than ever before. They have secured the heating of the Globe Hotel, at Collingwood, Ont., which is being doubled in size, and likewise the heating of R. H. Gray & Co.'s warehouses, Toronto, which are to be rebuilt larger than ever.

ALONZO McMANUS, New Britain, Conn., is erecting a new residence which will be heated by steam.

F. W. GIDDINGS, New Britain, Conn., will erect a \$10,000 residence, to be heated by steam.

NUTTER & SEABURY, 51 Oliver street, Boston, Mass., have closed the following contracts in which they will use the steam and hot water boilers made by the J. H. McLain Company, Canton, Ohio: A double apartment house for Charles Gould at Chelsea, Mass., with two Hummer hot water heaters; two three-flat apartment houses for Thomas Fee, Dorchester, using one D and one E Hummer hot water heater; one three-flat apartment house for Architect George Zimmer, using one D and one G Hummer hot water heater; Cambridge steam heaters will be used in the residences of W. H. Corson, at Brockton, and Dr. Whiting, at Sumnerville.

HARVEY & LEWIS, Hartford, Conn., are erecting a six-apartment house block, to be heated by hot water and to have a plumbing system.

THE S. H. BEARD COMPANY, New Britain, Conn., have the contract for the plumbing of the Nihil Block.

GREEN & LOGAN have the contract for the plumbing in a \$6000 two-family house in Bridgeport, Conn., for H. P. Averil.

SEALED PROPOSALS will be received for the plumbing and drainage for the City Hall Building of Rochester, N. Y., until May 20, at the office of the City Clerk, No. 23 City Hall Building.

FREDERICK SABINE, 146 North Second street, Philadelphia, states that he wants everybody to know that George Lodge will use the Specialty hot water furnace in 155 handsome dwellings which he is erecting at Morris and Tasker streets, Philadelphia, and that the kitchens will be furnished with an Active Fortune range with gas attachment.

E. B. KAISER & Co., 161 Southport avenue, Chicago, have the contract for the plumbing and drainage in the residence of F. T. Connor, 913 Hammond avenue.

PARK BROS., 79 Dearborn street, Chicago, are to do the plumbing and drainage in the two flat buildings of H. T. Davis, 4543 and 4545 Vincennes avenue.

HENRY BAUER, 232 North avenue, Chicago, has the contract for the plumbing and drainage in the flat building of Mrs. Ries, Buckingham place.

G. A. FEHR, 76 Canalport avenue, Chicago, is to do the plumbing and drainage in the flat building of Charles O'Connell, Sawyer and Twelfth streets.

R. TAIT, 605 Sixty-ninth street, Chicago, has the contract for the plumbing and drainage in the flat building of C. Sikema, 6002 Morgan street.

WILLIAM READ, 345 Forty-second street, Chicago, is to do the plumbing and drainage in the residence of J. F. Grok, Paulina street, between Fifty-fifth and Fifty-sixth streets.

SMITH & DORNEY, 1046 North Western avenue, Chicago, have the contract for the plumbing and drainage in the flat building of J. Kildahl, North Hoyne and Iowa streets.

F. SCHOLEFIELD, 310 South California avenue, Chicago, is to do the plumbing and drainage in the flat building of H. Schroeder, 28 North Francisco avenue.

PAUL JAESKE, 42 Centre street, Chicago, has the contract for the plumbing and drainage in the flat building of Paul Kohl, 30 Cooper street.

IRA T. SCHMIDT, 145 Michigan street, Chicago, has the contract for the plumbing and drainage in the residence of J. A. Cope, 447 Belvidere avenue.

P. EICHENBAUM, 815 Armitage avenue, Chicago, is to do the plumbing and drainage in the residence of L. Pierce, 89 and 91 Laughlin street.

P. NACEY & Co., 339 Wabash avenue, Chicago, have the contract for the plumbing and drainage in the apartment building of P. & B. Mahon, State and Twentieth streets.

THE CINCINNATI HEATING & VENTILATING COMPANY, bid \$2150 and secured the contract for the heating and ventilating apparatus for the new school building at Ludlow, Ky.

KENNEDY & SULLIVAN, Holyoke, Mass., who were given the contract for heating and ventilating the Hamilton Street School Building for \$3425 have declined to accept the contract from the city. Chairman Wall of the city committee called a special meeting and after hearing a statement from the Holyoke Steam & Gas Pipe Company it was voted to give this firm the contract for \$2485.

SEALED PROPOSALS will be received until 2 P.M., on May 23, 1895, by the Board of County Commissioners of Watonwan County, Minn., for steam heating a two-story brick and stone Court House Building to be erected in the village of St. James, in full accordance with plans which may be seen at the office of the clerk of the board, Theo. Sonstebj, St. James, Minn., and also at the office of the architect, H. C. Gerlach, Mankato, Minn., and also at the office of the Builders and Contractors' Exchange, St. Paul, Minn.

MCDERMOTT & ASHENBURG, Little Falls, N. Y., secured the contract for plumbing

and heating the Court House to be built at Herkimer, N. Y., for \$1450.

G. H. TAYLOR, Wakefield, Mass., has been awarded the plumbing and heating contract for seven new houses to be built by C. S. Hanks in Wakefield Park.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until June 5, for low pressure return circulation steam heating apparatus for the United States Marine Hospital at Vineyard Haven, Mass. Drawings and specifications may be had from the Supervising Architect at Washington, or from the superintendent at Vineyard Haven.

THE RINGEN STOVE COMPANY of St. Louis, Mo., have been awarded the contract for heating the Harrison School, in which the Huyett & Smith heating and the Powers ventilating systems will be employed.

MCADDEN & CRAIG, Pittsburgh, Pa., have been awarded the contract for the plumbing of the new plant of the Westinghouse Machine Company, at Brinton, Pa., on the main line of the Pennsylvania Railroad, about 11 miles from Pittsburgh.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until June 18 for low pressure return circulation steam heating and ventilating apparatus for the United States Post Office Building at Haverhill, Mass. Drawings and specifications may be obtained from the Supervising Architect, Washington, or from the Superintendent at Haverhill.

J. F. SCHUB, Ann Arbor, Mich., has the contract for putting in hot air and steam heating combination in the Congregational Church.

Argon.

Much interest has been excited in the scientific world of late by the discovery of a new constituent of the atmosphere, which has been made by Lord Rayleigh, in England. To this constituent the name of "argon" has been given. The first specimen of the substance that has been received in America arrived recently at the University of Pennsylvania. The gas came inclosed in glass tubes about 6 inches long. Dr. George F. Barker of the Department of Physics of the University gave, in Philadelphia last week, a very interesting lecture on the subject. A tube of argon was illuminated by an electric spark, by which its spectrum was observed. There were exhibited at the same time specimens of the gases hydrogen and oxygen, and the spectrum of each was noted. A decided difference was observed in the spectrum of argon. Dr. Barker gave the history of the discovery of argon by Lord Rayleigh. He stated that this discovery was brought about by the fact that there had always been discrepancies in the nitrogen obtained from the air, but that the same discrepancies in the nitrogen derived from chemical composition were not observable. Lord Rayleigh, in 1892, 1893 and 1894, obtained the weight in grains of a certain volume of gas nitrogen as derived from four different chemical compounds and found the weight of the like volumes the same. An equal volume of the gas derived from the air gave an increased weight and the separation of the nitrogen in the air resulted in the discovery of the new constituent and, possibly, in the discovery of a new element. Argon has been condensed to a colorless fluid under a pressure of 38 atmospheres. It belongs to the so-called "permanent" gases, and as regards liquefaction it occupies the fourth place, coming between carbon monoxide and oxygen. It differs from oxygen in being solidifiable. The question of whether or not it is an element has not yet been decided to the satisfaction of the scientists.

TRADE REPORT.

The Iron Market.

The general advance in blast furnace wages in the principal Western districts puts all chance of lower Bessemer Pig Iron at rest for the present. The raising of wages at a number of Steel works and rolling mills foreshadows a general movement in that direction throughout the whole territory north of the Ohio River and the Alleghenies, and may affect the Eastern makers also. The fact that a leading Pittsburgh concern put up wages in spite of existing contracts with the men is likely to prove a powerful argument with the dissatisfied in other districts. From the standpoint of the buyer this means that prices recently current, and in some sections still prevailing, will not be witnessed again, unless there is a sharp decline in the demand.

Local Foundry Irons in Chicago and in the East are selling quite well, and on the seaboard a slight advance is being obtained in some instances, with more hesitation to contract for the future. The Pocahontas Coke strike has caused the banking of a number of Virginia furnaces.

With the rising tendency in our markets encouragement is given to efforts to get manufacturers together for mutual advantage. The Western Bar Association is doing well. The Wire Nail people are to-day working at the formation of an association. The Cut Nail manufacturers are traveling in the same direction. The Western and Southern Cast Iron Pipe shops are trying to get together, and the makers of Merchant Steel are in conference. Report has it, too, that a movement is progressing to arrange for a common sales agency for Connellsville Coke.

The Metal markets have been quite excited. Copper has been stimulated by a sudden and excited rise in London, for which the ostensible reason is an agreement to limit American exports to 60,000 tons per annum. If such an arrangement exists it does not include important interests. Really the advance is due to an expanded demand.

There has been a heavy movement in Lead in all the primary markets and prices have been sharply advanced, with sellers at the close holding off.

Labor troubles in Kansas, which it is suspected were cleverly engineered, have advanced prices to 3.60¢, and are expected to have a depressing effect on Ore prices, thus helping makers both ways.

Pig Iron.—There has been a fair volume of business in the New York market, and the tone is firmer. Eastern makers have not changed their prices to regular customers, but it is understood that for the first time in a considerable period shipments of some of the leading makers are exceeding current production. We quote \$12 @ \$12.50 for No. 1; \$11 @ \$11.25 for No. 2, and \$10.25 @ \$10.50 for No. 2 Plain, standard brands, tidewater delivery. Southern Iron, same delivery, is selling at \$11.25 @ \$11.50 for No. 1; \$10.75 @ \$11 for No. 2; \$10.25 @ \$10.75 for No. 3; \$10.50 @ \$10.75 for

No. 2 Soft, and \$10.75 @ \$11 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$10 @ \$10.25.

The general situation in the Philadelphia market seems to favor the selling interests, and in recent transactions small lots of Pig Iron have been taken at about 25¢ advance. Prices are more variable than usual. In some cases \$11.25 is quoted for No. 2 Foundry, more frequently \$11.50, and in a few instances still higher prices are asked, but in the majority of cases \$11.50 is a fair average quotation. The supply is somewhat curtailed by the banking of the Virginia furnaces, but there is enough to go around, and at the moderate advance mentioned there is little doubt that plenty of Iron can be had. At the old prices large sales could still be made, but there is a general disposition to maintain the advance, which, in view of the higher cost of production, appears to be fully warranted. General quotations are as follows for Philadelphia and 30¢ @ 50¢ less for deliveries at points within 100 miles South or West:

Standard No. 1 Foundry X.....	\$12.00 to \$12.50
Standard No. 2 Foundry X.....	11.25 to 11.50
No. 2 Plain.....	10.75 to 11.00

A decidedly active week has been experienced by manufacturers of local Coke Iron in the Chicago district. Contracts have not been large, but orders have been numerous. Prices are very firm with a continuous upward tendency. Southern Coke Iron has been comparatively quiet, but a few fair contracts were entered during the week. Soft Irons and No. 2 Foundry are now exceedingly scarce, and attention is being diverted a little more strongly to Ohio Irons to meet the demand for Soft grades. Lake Superior Charcoal is in better demand, and one seller reports sales aggregating 3000 tons the past few days. Quotations are as follows, for cash:

Lake Superior Charcoal.....	\$13.00 to \$13.50
Local Coke Foundry, No. 1.....	10.50 to 10.75
Local Coke Foundry, No. 2.....	10.25 to 10.50
Local Coke Foundry, No. 3.....	9.75 to 10.25
Local Scotch No. 1.....	10.50 to 11.00
Ohio Strong Softeners, No. 1.....	12.50 to 13.00
Southern, No. 1, Soft.....	12.00 to 12.25
Southern Silvery, No. 2.....	11.75 to 12.00
Southern Coke, No. 2.....	10.50 to 10.75
Southern Coke, No. 3.....	10.00 to 10.25
Southern, No. 1, Soft.....	10.50 to 10.75
Southern, No. 2, Soft.....	10.25 to 10.50
Alabama Car Wheel.....	17.50 to 18.00
Jackson County Silvery.....	13.50 to 13.75
Other Ohio Silvery.....	12.25 to 12.50

The week has been very active in the Pittsburgh district, with large purchases of Bessemer Pig at improved prices. There is also a very much better demand for Foundry, and prices have advanced and are expected to go still higher. Buyers of Pig Iron evidently believe it is a good time to buy and are placing orders very freely. Furnace owners are naturally much pleased with the improvement in the situation and believe they are about to have a period of prosperity that will last for a considerable time. In the feverish condition of the market it is somewhat difficult to quote, but for May and June delivery lower prices can be secured than for delivery after July

1. For delivery this and next month we quote as follows:

No. 1 Foundry.....	\$10.00 to \$11.00, cash
No. 2 Foundry.....	10.25 to 10.50 "

Advices from the Cincinnati Pig Iron market state that a stronger and more confident feeling has been established for Foundry grades, which have sold quite well during the past few days at full prices. Lake Superior Charcoal grades have been especially active, but there has been some increase in the sales of Coke Irons as well. Southern producers show no disposition to recede from their recent strong position, and for delivery after three months demand a further advance of 25¢ per ton, but as a rule recent transactions have been for delivery between now and August. Advices from manufacturers and melters of Pig Iron are encouraging. Orders for manufactured products are being received beyond expectation, and already the volume of business transacted thus far during the current year exceeds that of last year and in some cases more than two years ago. With the present condition prosperous, confidence for the future is entertained. Quotations are given as follows:

Southern Coke, No. 1.....	\$10.00 to \$10.25
Southern Coke, No. 2.....	9.50 to 9.75
Southern Coke, No. 3.....	9.00 to 9.50
Southern Coke, No. 1 Soft.....	10.00 to 9.25
Southern Coke, No. 2 Soft.....	10.00 to 14.50
Ohio Soft Stone Coal, No. 1.....	14.50 to 15.00
Ohio Soft Stone Coal, No. 2.....	14.00 to 14.50
Lake Superior Coke, No. 1.....	11.75 to 12.25
Lake Superior Coke, No. 2.....	10.75 to 11.50
Hanging Rock Charcoal, No. 1.....	10.00 to 11.00
Hanging Rock Charcoal, No. 2.....	10.00 to 10.50
Hanging Rock Charcoal, No. 3.....	10.00 to 9.50
Tennessee Charcoal, No. 1.....	13.00 to 13.50
Tennessee Charcoal, No. 2.....	12.00 to 12.50

The lull in the St. Louis Pig Iron market continues. There are still a number of good sized orders in the market, however, which when closed will keep furnaces well employed. Reports from producers indicate that their output is being shipped as fast as possible, and that there is no opportunity to stock up. Locally, the situation is excellent. Car builders, stove manufacturers, architectural works and machine shops are all busy, and are urging furnaces to fill their orders without delay. Prices are well maintained, and there is at present no disposition to shade the quotations shown below. We quote as follows for cash f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry.....	\$10.25 to \$10.50
Southern Coke, No. 2 Foundry.....	10.00 to 10.25
Southern Coke, No. 3 Foundry.....	9.50 to 9.75
No. 1 Soft.....	10.00 to 10.25
No. 2 Soft.....	9.75 to 10.00

A FIRE which occurred last week in the works of the St. Joseph Pump Company, St. Joseph, Mo., caused a loss of about \$10,000 in the galvanizing plant and machinery shop. On Monday a further loss of \$45,000 was suffered by the concern in the burning of the rest of their works. The origin of the fires is unknown, but they are supposed to have been the work of tramps. The plant will be rebuilt at once. The loss is said to be largely covered by insurance.

Metal Market.

Copper.—Prices have undergone a sharp advance and the market is very strong. Deliveries are being made very freely, but the consumption is heavy, leaving little to offer for delivery this month or next. Export movement is quite free, but chiefly on old contracts. There is still more or less speculative interest in the market, but the late short interest has, it is understood, been covered to a considerable extent. A very large demand exists at the present time for Copper for telephone, telegraph, trolley and other requirements, and this branch of consumption is likely to increase in its requirements during the coming months. Consequently the outlook in the Copper market is regarded as exceedingly good. In retail business the demand has been comparatively brisk during the week. The price for small lots of Lake Ingot from store has been advanced to 11½¢ per lb. Common Casting Copper is quoted at 10½¢ @ 10¾¢. A press cable dispatch received from London at the close of the week states that the European producers of Copper have agreed to reduce their output 7% in connection with the agreement of the American Copper producers to restrict shipments to 50,000 tons for a year.

Sheet Copper.—In common with the market for almost all other metals, that for Manufactured Copper has improved very materially in the course of the past week. Several large orders for Cornice Copper have been placed in this section and the inquiry is extremely good. It is expected that the demand for this material will prove to be of unusually large proportions during the coming months. The producing mills are all busily at work on orders. Prices for Sheet Copper are decidedly stiffer, and it is regarded as possible that an advance will be made in the list by manufacturers before very long if the recent advance in the price of raw material proves to be permanent. As it is, manufacturers are not quoting on delivery beyond the month of June, and they are little inclined to make any large contracts even as far ahead as that time. Quotations on small lots of Sheet Copper are unchanged at the net list price of 14¢ per lb.

Pig Tin.—Straits Tin in the wholesale market has been sold as high as 15½¢ in 5-ton lots, but prices receded somewhat later in the week under the influence of a slight decline in the London market. Speculation has been fairly active, but dealings were hardly as large as might have been expected in view of the sharp movement in prices and stimulating reports from the London market. Consumptive demand has been active and prices for moderate sized parcels from store have been advanced ½¢ @ ¾¢, Straits Pig being now quoted by jobbers at 15½¢ @ 16¢ per lb. The jobbing price for Bars is 17¢ and for Banca, 16½¢ @ 16¾¢.

Pig Lead.—A large business has been done and prices have advanced sharply, partly under the influence of speculation, but purchases by consumers and the strong position at primary points have been the main cause of the improvement. Small business has been good, with prices for moderate jobbing quantities stronger at 3½¢ @ 3¾¢ per lb.

Lead Pipe and Sheet.—The renewed activity in the demand for Manufactured Lead, referred to last week, continues unabated. Large orders for Pipe and Sheet received by the plumbers' supply

houses in this city show that stocks in consumers' hands are being widely replenished, and a largely increased volume of inquiry of a substantial kind indicates the return of confidence among purchasers, as a much larger proportion of the inquiry develops into orders than has been the case heretofore. The outlook for a good business is considered very favorable, and the possibility of a return of better prices for manufactured Lead is being discussed now that the raw material is improving its position. Prices in this section are maintained at the list basis of 5½¢ for Pipe and 6¼¢ for Sheet, subject to the usual discount of 20%.

Spelter.—Prices show an advance for the week. The inside rate for small lots from store is quoted at 4¢ per lb for good Western brands. Purchases by consumers have been liberal, and some buying for export account has taken place also, while speculative operations have figured with more prominence than for some time past. The tone of the market in general displays considerable improvement.

Sheet Zinc.—The flurry in the market for Sheet Zinc, referred to in our last report, has continued during the past week, and a further advance of about 1¢ per lb has been made in the interval. Stocks are everywhere extremely light, and it is almost impossible at present to get any quantity from the mills, which are reported to be crowded with sufficient orders to keep them employed for some weeks to come. It is believed that if the demand continues in as large a volume as at present, prices for Sheet Zinc will advance still further within the near future. The bulk of the present requirements is said to come from the fruit jar trade, and this class of consumers seem likely to increase their requirements rather than to diminish them. At the present time Zinc in casks is not to be had at less than 6½¢ per lb in this market, and no large quantity can be obtained at short notice under any circumstances just now. For broken lots jobbers are asking 7¢ per lb.

Antimony.—There is rather better tone to the market, but prices have not gone above 8¢ for Hallett's and 9¢ for Cookson's, in small parcels.

Nickel.—Quotations are 35¢ @ 40¢ per lb, according to size of lot.

Tin Plates.—A considerably better feeling has developed in the market during the week under review. A very fair amount of business has been done in foreign Cokes for future delivery; but spot orders in this line continue very moderate in extent. It is expected that canners' requirements will shortly call for a very considerable amount of this material, and importers are looking on this trade to help them out on past deficiencies. So far as can be discovered, the outlook for an exceptionally large business for the canning trade this season is very bright. It was feared that the recent frost in some parts of the country would be likely to seriously affect this class of consumers, but the latest news is reassuring as to the extent of the damage done by it to the fruit and other early crops. Sales of Charcoal Tin have been merely moderate. Relatively the largest business has been done in American Terne Plates, prices for which have been but a fraction below the most attractive terms on foreign material. Stocks of imported plates are not at all large, either on this or the other side of the water,

and the market appears to be gradually strengthening both here and there. Should any considerable increase in the demand spring up it is expected that prices will advance unless the output of Domestic Plates increase sufficiently in volume to neutralize the effect of restricted imports. Home production is gradually increasing, and the use of American Tin and Terne Plates grows correspondingly. It is the general opinion of the trade that the day of Welsh Roofing Plates in this country is entirely past, and that in the near future this material will be exclusively supplied from American works. At the present time a large amount of the demand from consumers for Terne Plates is filled directly from the works; and, excepting for purely local business, Eastern dealers and jobbers are month by month handling less of this class of Plates.

A special cable dispatch from London, dated May 15, to *The Iron Age* reports on the British Tin Plate market as follows: The Tin Plate market has been less active, owing to firmness of makers and buyers being unwilling to pay enhanced prices. Shipments to Russia have been large. Stocks at shipping port are estimated at 236,000 boxes. Quotations, f.o.b. Wales, are as follows:

Bessemer Cokes, 1C 14 x 20	9/	9/3
Siemens Cokes, 1C 14 x 20	9 ¼/	9 ½/
Terne, 20 x 28	9 ¼/	9 ½/
Charcoals, 1C 14 x 20	11/	13/6

Sheet Iron.—The condition of both Black and Galvanized Sheets is steadily growing better. A very large demand exists for both descriptions of Iron, and prices for Common Black Iron are quoted higher this week. Mills continue to take orders only up to July 1, under the understanding entered into by the manufacturers a few weeks ago. Galvanized Iron is in particularly active demand in this section, but agents are making quotations for immediate acceptance only at current rates. It is thought that list prices must shortly advance in sympathy with the rise in values of all other iron products. Light Sheets for tinning purposes are active and firm. Small lots of No. 27 Common Iron, from store, are quoted at 2.80¢ per pound. Galvanized Sheets are quoted at 75 and 5 % @ 75 and 10 % off, according to size of order and conditions of delivery.

Chicago Report.

Scrap.—The local trade has been light, but country merchants have been selling briskly to their neighboring mills. Dealers quote their buying prices as follows, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap.....	\$6.50	...
Machinery Cast.....	5.50	...
Malleable Cast.....	5.00	...
Stove Plate (free of burr).....	4.00	...
Burnt Iron and Grate Bars.....	3.00	...
Sheet Iron and Hoops.....	2.00	...
Plow Steel and Breaking Stock.....	4.00	...
No. 2, such as Shovels, Hoes, &c.....	3.00	...
Old Boilers—whole (Iron).....	3.00	...

CONDITION OF THE

Hardware Trade.

A CONTINUED IMPROVEMENT in business is noticeable, showing itself not only in an increased volume of sales, but more decidedly in the better tone which pervades the market and the more hopeful feeling which rules, not only in Hardware circles, but in other lines of trade, some of which feel the improvement more positively than do the Hardware and Iron interests.

During the past week the Hardware market has experienced few openly announced changes in price, but there is a perceptible stiffening on some lines which have been irregular and low. As a result a good many extreme quotations have been withdrawn. The trade are buying with less reserve and showing a willingness to anticipate their wants more generously than heretofore, a disposition which is induced by the increased demand which is setting in upon them from their customers. Some of the large buyers are placing orders quite freely without solicitation, especially for the many lines which are acknowledged to be low and in which a further decline is not anticipated. Under these circumstances it is the part of wisdom for manufacturers to be very careful about booking orders for future delivery at present prices. There are uncertainties in regard to labor and the raw material which should be carefully considered, and it is desirable that manufacturers should be in a position to avail themselves of any favorable turn in the market rather than be loaded up with orders at unremunerative prices. Some of the strength which characterizes the market is undoubtedly the result of conference and agreement between the manufacturers, and this is not as significant as it would otherwise be of the general tendency of the market. Apart from such movement, however, there is undoubtedly a better tone, although the improvement is sometimes exaggerated in the references to it by the daily press. It will be seen from the special reports given below that many sections are experiencing this better feeling, and that our correspondents consider that the tendency of things is evidently toward a still further improvement, with a prospect of an excellent old time business before long.

Advices from Chicago.—Shelf Hardware continues active and goods are now moving in larger quantities than at any previous time this year. All kinds of merchandise are in excellent demand, with a specially heavy movement in seasonal goods owing to the recent hot weather. House Furnishing Goods are called for much more freely. Tinware and Tin Plate are active. The Bicycle trade is heavy, with special scarcity in ladies' wheels. The situation has been greatly improved by the strengthening of prices in staple goods. This change was all that was needed to give buyers confidence in a better basis of values. Prices are hardening on many lines and quotations now received by jobbers are in most cases for immediate acceptance only. Instances are reported in which quotations have been withdrawn by wire before mail advices were received by the buyer. Prospects for future business are as bright as ever. It is not believed that the frost of the past week has done so much damage as is indicated in the daily press.

Notes on Prices.

Wire Nails.—The improvement in the Wire Nail market, to which reference was made in our last issue, has continued, with a further and marked strengthening in tone. Manufacturers continue to quote only for immediate shipment and refuse to accept orders for delivery later than May 31. They are evidently determined to have their order books cleared by June 1, that they may thus be in a position to put into operation the plan on which manufacturers have been working for some time. In the mean time prices are decidedly higher and several of the leading mills refuse to quote less than \$1, f.o.b. mill. There are other mills, however, by whom, up to this time at least, the quotation of 95 cents is made, and in some cases this has been slightly shaded. The price from store in New York has also been advanced to \$1.25. It is understood that negotiations with a view to completing the agreement under consideration have been progressing favorably, and an important meeting of the manufacturers, at which the matter may be determined, is being held today, but up to the time of going to press we are not in receipt of advices as to the action taken. It is obvious that to have the movement a successful one it will be necessary to have a strong organization, which will control the output and regulate the policy of the associated manufacturers.

The policy which will be adopted in regard to prices is a matter in which the trade are also much interested, and an effort will be made to conserve the interests of the jobbing trade, by whom the goods will, of course, be principally distributed. It is not intended, we are advised, to make a price that will be unduly high, though it will be necessary to make a considerable advance on prices which are now ruling. It is anticipated that the new arrangements will call for a revision of the Nail card, and perhaps some radical changes in this direction. The advisability of recasting the list from which miscellaneous Wire Nails are sold is also being considered. The important question in which the trade are principally interested is as to the probability of this arrangement being put in operation. It is, of course, impossible to forecast the outcome of a matter which is beset by so many difficulties and con-

nected with which there are so many conflicting interests, especially as several carefully devised plans looking to the same end have heretofore proved unsuccessful. Those, however, who are most closely identified with the movement are hopeful of its success. It will certainly be a desirable thing for the trade at large if some such arrangements are consummated and result in giving regularity and evenness to the market.

Advices from Chicago.—The past week was quite an exciting period in the Wire Nail trade. The jobbers advanced their quotations to \$1, as stated in last report, and at the close of the week made another advance to \$1.10, Chicago, for lots of all sizes. Manufacturers advanced their prices fully as rapidly and are now quoting factory lots on the basis of \$1.10, Chicago delivery. All orders recently taken by them have been for May delivery only with immediate specifications and subject to the ability of the mill to ship before June 1. Many inquiries have been received for June shipments, which have invariably been turned down. A considerable advance is expected on prices for future shipment when manufacturers decide to begin to book such orders.

Cut Nails.—There is no change in the price of Cut Nails, the market for small lots from store in New York being represented by 95 cents, this quotation being made on the basis of 60-cent average, with an advance in the base price where the average is less. The market has a perceptibly firmer tone, and the trade would not be surprised if advanced prices were announced before long. It is understood that the manufacturers have been conferring with a view to reaching some understanding by which prices will be maintained, and possibly advanced, especially in case the proposed negotiations between the Wire Nail manufacturers are carried into effect. The Cut Nail mills naturally desire to be in a position to avail themselves of any improvement in the market, and at the same time the Wire Nail manufacturers, who are anticipating the announcement of considerably higher prices for their goods, will welcome any action taken by the Cut Nail mills which will make a corresponding advance in the price of Cut Nails.

Advices from Chicago.—Manufacturers report the continuance of fair sized orders. They have made a slight advance in prices, but anticipate a larger advance in the near future. Jobbers quote small lots at \$1

Barb Wire.—The Barb Wire market is characterized by a somewhat firmer tone and some low quotations have been withdrawn. The volume of business is good.

Advices from Chicago.—The condition of the Barb Wire trade corresponds with that of Wire Nails. Jobbers have advanced their prices on small lots to \$1.65 for Painted and \$2 for Galvanized. They would probably make a concession of 5 cents per hundred on carload lots, but these quotations are liable to change very quickly in view of the stiffening of prices by manufacturers. The demand has been heavy, raw materials are dearer, labor is uneasy, and a decided upward movement in prices would not be surprising.

Old Metals.—There has been a considerable improvement in the market for Old Metals, and the outlook is regarded as favorable for this class of

material. Higher prices for Ingot Copper have been followed by an advance in the prices of Old Brass and Copper. The demand for Scrap Iron has been good, but no change has yet developed in prices, which are fairly held at last week's quotations. Dealers' purchasing prices for moderate sized lots, New York or Jersey City delivery, are about as follows:

Heavy Copper.....	lb 7½¢
Light and Tinned Copper.....	lb 7 ¢
Heavy Brass.....	lb 5½¢
Light Brass.....	lb 4½¢
Lead.....	lb 2½¢
Tea Lead.....	lb 2½¢
Zinc.....	lb 2½¢
No. 1 Pewter.....	lb 9½¢
No. 2 Pewter.....	lb 4½¢
Wrought Scrap Iron, gross ton.....	\$7.50 @ \$8.00
Heavy Cast Scrap..... gross ton.....	7.50 @ 8.00
Stove Plate Scrap..... gross ton.....	5.00
Burnt Iron..... gross ton.....	3.50

Old Rags, Paper, &c.—The general condition of the market is favorable, with a moderately good demand for Paper Stock, and the outlook is regarded as good for a stimulation of business in the near future; meanwhile quotations remain virtually unchanged. Dealers' purchasing prices, New York delivery, rule as follows:

No. 1 White Rags.....	lb 3 ¢ @ 3½¢
No. 2 White Rags.....	lb 2½ ¢ @ 3¢
Mixed Rags.....	lb 1 ¢ @ 1½¢
Blues and Sds.....	lb 1 ¢ @ 1½¢
Hard Sized White Shavings.....	lb 2½ ¢ @ 3¢
No. 1 White Book Shavings.....	lb 1½ ¢ @ 2½¢
No. 2 White Book Shavings.....	lb 1 ¢ @ 1½¢
Light Book Shavings.....	lb 1 ¢ @ 1½¢
No. 1 Mixed Shavings.....	lb ¾ ¢ @ 1 ¢
No. 2 Mixed Shavings.....	lb ¾ ¢ @ 1 ¢
No. 1 Printed Books.....	lb 1 ¢ @ 1½¢
Ordinary Mixed Books.....	lb ¾ ¢ @ 1 ¢

No. 1 Manila Paper.....	lb ¾ ¢ @ 1 ¢
No. 2 Manila Paper.....	lb ¾ ¢ @ 1 ¢
Bogus Paper.....	lb ¾ ¢ @ 1 ¢
Common Paper.....	lb ¾ ¢ @ 1 ¢
Straw Chips.....	lb ¾ ¢ @ 1 ¢
Binders' Clippings.....	lb ¾ ¢ @ 1 ¢
Jute Butts.....	lb 1½ ¢ @ 1½¢
No. 1 Jute Bagging.....	lb 1 ¢ @ 1½¢
Mixed Bagging.....	lb ¾ ¢ @ 1 ¢
No. 2 Bagging.....	lb ¾ ¢ @ 1 ¢
Hemp Twine.....	lb ¾ ¢ @ 1 ¢
Manila Rope.....	lb ¾ ¢ @ 1 ¢
Jute Rope.....	lb ¾ ¢ @ 1 ¢
Mixed Rope.....	lb ¾ ¢ @ 1 ¢

Old Rubber.—The market is rather stronger, with some slight improvement both in the demand and in prices. The following quotations represent about the current prices paid by New York dealers:

Car Springs, ton lots, gross lb.....	3 ¢ @ 3½¢
Rubber Shoes, carloads, delivered at factory, gross lb.....	4½¢
Rubber Shoes, less than carloads, gross lb.....	4½¢
White Wringer Rolls, gross lb.....	3½¢
White Syringes, gross lb.....	3½¢

Trade Notes.

THE NEW MACHINE SHOP for the Goulda Mfg. Company, at Seneca Falls, N. Y., will be designed and built by the Berlin Iron Bridge Company of East Berlin, Conn. The building, as designed, will be constructed with a steel frame and a 15 ton traveling crane.

THE MEEKER FOUNDRY COMPANY, Norwalk, Conn., are to enlarge their plant.

THE CO-PARTNERSHIP which has conducted the business of the Union Jobbing Foundry, Stamford, has been dissolved, Wm. S. Reynolds retiring. The business will be continued by Frank A. Jones and Emil A. Young, under the old firm name.

THE UNITED STATES HEATER COMPANY are having great success with

their Capitol Graphite Pipe Joint Cement, which they offer to the trade as a desirable substitute for red or white lead. It is intended for use on all kinds of screw joint pipe work. They claim it is not affected by gas, ammonia, alkali or any liquors, makes a perfect joint—one that may be opened with ease at any time—and is very economical, 1 pound of the mixture being more than three times the bulk of 1 pound of lead. They will send a 5-pound sample can by express on receipt of 75 cents in stamps.

A ONE-STORY ROLLING MILL, 120 x 121 feet, is being built at Olney, Pa., by the Parsons Manganese Bronze & Copper Company of that place.

THE COMINS MFG. COMPANY, Upper Sandusky, Ohio, have added the manufacture of the Underwood Gas and Gasoline Engines to their business, and will push these goods considerably. At present it is said that the demand for the engines is greater than the supply.

THE LALANCE & GROSEAN MFG. COMPANY, 19 Cliff street, New York, report a remarkable expansion in the demand for their Milk Cans and Milk Can Stock. This department of their factory, at Woodhaven, L. I., is kept running full, night and day, to satisfy orders. The company are now enlarging their facilities to meet the increase in their business in connection with these goods. They have lately brought out a new Patent Handle for Milk Cans which has been much appreciated in consequence of the greater ease which it affords in the handling of the cans.

H. MILLER & SON, Baltimore, Md., propose making some considerable improvements and extensions in their Tin Box and Can works during the summer.

THE STOCKHOLDERS of the New Britain Brass Company, New Britain, Conn., have organized, with the following board of directors: John Walsh, John F. Reynolds, Peter Long, B. F. Gaffney, Samuel Bassett, John Sheehan and P. J. Flannery. The following officers were elected: John F. Reynolds, president; P. J. Flannery, vice-president; B. F. Gaffney, secretary; Peter Long, treasurer. The capital stock of the company is \$10,000. The company will manufacture a general line of Brass Goods. It has not been decided as yet as to whether the company will build a new factory or have their manufacturing done at one of the large factories in town. It is probable that the latter course will be pursued for the present. The officers of the company are arranging to begin work as soon as possible.

DE WITT WIRE CLOTH COMPANY, until recently at 32 Reade street, New York, have moved to 17 Warren street, where they have the steel floor and two basements. Having outgrown their former quarters they were compelled to enlarge their business facilities, having now three floors, each about 75 x 25 feet in dimensions. They manufacture and deal in almost every description of Wire Cloth, including Woven Wire Cloth for Window and Door Screens, Brass Wire Cloth, Strainer Cloth, Bronze and Tinned Copper Wire Cloth, Iron Wire Cloth, Galvanized Wire Cloth, Poultry Netting, Wire Ropes and Sash Cord, Brass, Copper, German Silver and Aluminum Wire, Door and Window Screens, &c. The company have factories at Belleville, N. J., and Philadelphia, Pa., the whole being under the supervision of F. J. Bartlett, president and general manager, who also spends a

considerable portion of his time at the New York office.

THE RIDGWAY FURNACE COMPANY, 6 Portland street, Boston, Mass., in their page advertisement in another part of this issue, show the latest Ridgway Heater and refer to its special feature—viz., revolving open fire pot—and to the fact that the Furnace is sold to the trade only. A catalogue will be sent to all inquiring dealers.

THE MICA WORKS of John A. White, Warren, N. H., were burned out on May 15, with loss of \$15,000, partly covered by insurance.

A Rising Market.

The buyer may look forward to paying higher prices for his stock in the near future. In the many branches of trade there is no great amount of material in the warehouses and orders to any considerable extent will bring an advance in prices all around. In plumbers' materials discounts have been withdrawn and prices have already made an advance. Cast iron soil pipe and brass goods are now higher than they were a short time since. Some of the goods used by the steam fitter have risen and it is probable that radiators can be bought lower at this time than they can a little later on, as the prices are not perfectly satisfactory to the makers. It is thought that some who will need such goods are making a mistake in not taking advantage of the present low prices. The buyer, however, has so many times seen the market fall when a further drop seemed impossible that a hesitancy is felt about placing any confidence in a stiffening of the market now. There seems to be, however, a well grounded opinion that goods will, before long, cost more, and that when the buildings of the year reach a point where the finishing materials are needed a further advance is probable. It has become a general custom to buy in small lots, or only what was needed, with the expectation that the next purchase would be made at some concession in price, but this habit may now prove to be a disadvantage. Methods must change on a rising market or a loss will follow. Buyers who dispose of their goods quickly and are constantly in touch with the market are likely to catch its drift and prepare accordingly. Buyers who do not sell their stock so promptly are not apt to keep as well informed on prices, and sometimes establish a price which it is difficult to raise when the stock is replenished at a higher price. It does not require such

close attention to do a profitable business on the falling market of the past two years as is necessary to prevent loss on a rising market. It is the smaller tradesman who runs a diversified business who is in danger of losing sight of the market in one branch while engaged intently for some time in another branch. He is likely to contract for work in the unwatched branch at a lower figure than he would if he was well acquainted with the market. It is probable that some friction may arise in dealing when an advanced price for work or material is asked, but if the situation warrants it a little explanation and courage will result in an amicable understanding.

Competition.

Competition has its compensations as well as its drawbacks. There are many lines in which competition is obviously a great deal too severe for the welfare of the parties most deeply interested. It can be pushed entirely too far. Yet healthy competition, if such a term is permissible, is really desirable. This can be illustrated by a few instances taken from actual business experience. Some time since a manufacturer concluded to venture into a somewhat new and untried field and to make a higher class of goods than his trade had previously taken. For a considerable period his progress was slow and quite discouraging. But a watchful rival had perceived what was being done, and in the belief that the results were satisfactory boldly ventured in the same line. The additional advertising thus done and the more vigorous efforts then put forth to educate the trade greatly stimulated business, and, much to the surprise and satisfaction of the pioneer house, their orders rapidly increased and they found themselves firmly established in their new line much earlier than they had anticipated. Another instance is recalled in which a firm had by honest workmanship and careful methods built up a large trade for their products, made under a distinctive trade mark. They proved ultimately a shining mark for other manufacturers, who sought to occupy a part of their particular field. But these competitors made the mistake of invariably claiming that their products were "just as good" as those of the old house. The consequence was that the newcomers only succeeded in more firmly impressing buyers with the conviction that the old house made the standard goods for the trade. Again, it is rather a curious fact that in important trade centers it is frequently better to have three compet-

ing concerns than two, if there must be division of the local trade. When there are but two houses their prices are directly compared with each other by all customers, to the disadvantage of the dearer seller. With three houses or more a better chance exists for independent action to secure better prices.

Persistence.

Persistent effort—the determination to stick to a thing—has wrought success out of failure in many a case. Persistence and genius seldom go hand in hand, but every man may have the encouragement that what genius fails to do persistence may often accomplish. General Grant, in homely but emphatic language, gave us an insight into his persistent and indomitable character in those words to Lincoln: "I propose to fight it out on this line if it takes all summer." Few are the great and lasting things of this world that do not bear the marks of persistence. The power loom and the telegraph were not invented and adopted in a day. Good-year with his India rubber and Fulton with his steamboat met bitter opposition before success was assured, and the masterpieces of literature and art are, as a rule, the result of long continued effort. "If at first you don't succeed, try, try again," is not a motto for children alone. Adherence to its teaching can only crown man's efforts with success. In the common every day work of the shop these words should still be a guiding power, for certainly a man's ability is to be judged by what he accomplishes, and that in turn must depend upon his persistent efforts. The "stick to it" principle seems to be so much a part of the nature of some men that a difficult piece of work seems almost as good as completed if they are set to do it. Can any one question that this characteristic has not a money value and that the man who displays it will not be better paid than he who is thrown down by the first opposition and appalled by the first indication that there is trouble with his work.

The St. Pancras district, one of the largest divisions of the city of London, is erecting a new electric light station in conjunction with a garbage destructor, for the purpose of utilizing the heat generated by the combustion of house and street refuse for raising steam in boilers for dynamos to be installed for the electric lighting of a portion of the district. Similar steps are also being taken in the Shoreditch district of London, tenders being invited for the erection of a refuse destructor capable of dealing with 20,000 tons of refuse per annum. The combustion of this amount of refuse is expected to yield something like 400 horse-power.

THE LETTER BOX.

Brazing.

From G. M., South Boston, Mass.—Would you be kind enough to explain through the columns of *The Metal Worker* how brazing is done? A young man and myself are interested in bicycles and would like to build one, but brazing the joints sticks us.

Answer.—If the tubes of which the bicycle frame is composed are of steel, greater care would be required in brazing than with iron, as the former is more liable to be injured by overheating. The work to be joined is first prepared by filing or scraping, so a clean surface will be presented to the action of the flux. The parts to be joined are then placed in position and firmly secured by means of binding wire, riveting or clamps. Granulated spelter and borax are to be mixed with a little water in a dish, and then by means of a small spoon or V shaped strip of metal placed over the joint. This much done, the article is held over a clean charcoal fire, on a forge, until the moisture is slowly evaporated. Too much heat applied at once would cause the water to boil and displace the spelter. Heat is then applied until the article is brought to a cherry red heat, when the borax and spelter fuses, causing the latter to fill the joint. After the spelter has run through the joint the article can be taken from the fire and allowed to cool. In case the work

purpose, the air supply is usually furnished by means of a blower. Rubber hose of suitable size is attached to each tube of the blow pipe, and connected with the gas and air supply. If a forge is not at hand, a sheet iron pan is to be partly filled with coke, and on this a few pieces of charcoal laid. The blow pipe being lighted, and the blue flame being obtained by means of the stop cocks, the blow pipe is used to ignite the charcoal. The article is then laid on the charcoal and the flame of the blow pipe brought against the upper part and sides until the spelter melts and flows about the joint. The object of placing the work on the ignited charcoal is that the heat may be applied from below, while the blow pipe flame strikes the top and sides, thus melting the spelter and causing it to fill the joint.

Extending a Heating System.

From TRANSPANTED, New York.—I submit a picture of some work that was done to a steam heating system by an out of town steam fitter. After the job had been completed the owner built an extension to the house. Where the riser came through the floor he put a valve and connected it with a T hull headed, running a pipe from each side of the T to a radiator 20 inches high, the radiators being 1 foot apart. As a result one of the radiators works properly and the other fills with water. I

Extending a Heating System.

is of such a shape that it would be inconvenient to use the ordinary forge, it may be found necessary to employ a blow pipe, using illuminating gas and air. This kind of blow pipe requires about 8 parts of air to 1 of gas. In order that the air and gas should be properly mixed when burning, two tubes are used, one within the other, the smaller for gas and the larger for air. They are provided with stop cocks for regulating the supply of each, so a clear, blue flame will be the result. While the illuminating gas will probably have sufficient pressure for the

would like to have some of the practical readers of *The Metal Worker* describe how the connection should be made.

Riveting Iron Pipe.

From W. B., Chicago.—When joints of pipe made from heavy iron are to be riveted together, it is rather difficult to place the rivets through the holes. It is supposed the end holes are punched in the iron before forming, and then two joints are put together so the holes will come opposite. The next step is to put in the rivets. One method is to place a rivet on the riveting stake and then slip over the pipe until the hole is

over the rivet. As it is quite dark inside of the pipe, it is difficult to see the rivet, and besides it is liable to be knocked off the stake into the pipe. The operation is rather tedious, as the pipe must be removed from the stake for each rivet. Another method is to use a notched and split stick, into the end of which a rivet is placed. The stick is run into the pipe, and an effort made to push the rivet through the hole. If the operation is successful,

Riveting Iron Pipe.

the workman holds the rivet with his fingers until the pipe is placed on the stake. Unfortunately, the rivet is liable to slip out of the workman's grasp, when the operation must be repeated. In the accompanying illustration is shown a method by which the above-mentioned difficulties may be avoided. Let A B C represent the small end of a joint of pipe. The holes are punched so as to allow the rivets to slip through, but the holes should not be too large. It is convenient to place the joint of pipe on the stake with the small end next to the bench. A rivet is then placed in one of the holes, as shown at A, and by giving the end of the rivet a slight tap with a hammer an edge can be turned over that will prevent the rivet from slipping out. The remaining holes are then supplied with rivets in a similar manner. By placing the small end of the pipe into the large end of another joint so the rivet ends come opposite the holes and then placing the pipe on the stake, it is an easy matter to draw each rivet through and then do the riveting.

Varnish for Tools.

From M. R. N., Washington, D. C.—Please give me a receipt for varnish to keep bright tools and similar goods from tarnishing.

Answer.—A receipt given as a varnish for tools is as follows: Melt together 40 ounces of tallow and 2 ounces of rosin and strain while hot, apply with a brush to tools and it will prevent them from rusting. Another receipt described as a varnish for polished metal is to pound bleached shellac in a mortar and then put it in a bottle of alcohol, agitating the alcohol frequently until it has dis-

solved as much shellac as it will; then pour off the clear liquid. The metal surface is first warmed and the varnish applied to it with a brush, giving a transparent coating that will protect the polished metal.

Dripping Pan Corners.

From K. S. F.—In reply to the request of the correspondent, "A. C.," Milwaukee, for a method of securing

Dripping Pan Corners.—Fig. 1.—Plan of Pan Submitted by "K. S. F."

the pattern of a square pan made in one piece, with corners so cut as to come up under the wire, I submit the following plan of pattern, which may prove to be of value to him as well as to other readers of the paper. Referring to Fig. 1 of the accompanying sketches, draw to the desired length the lines A, B, C, D, which will represent the size of the bottom of the pan. Parallel to these lines and at a distance from them equal to the desired slant height of the pan draw the lines E F, H G, F H and E G. Continue the lines A, B, C, D and D A until they cut the lines previously mentioned at the points I. From the points I set off equal to the desired flare of the pan the points J. Draw the lines A J, B J, C J and D J. Place one point of the compasses at A, and with a radius A I describe the arc I I. Set off on the arc I I the distance J K, which equals I J. From A and through

Fig. 2.—Side View of Pan.

the point K draw an indefinite line, as A K; draw the lines A E, D G, C H and B F. Now from the point J, at right angles to the lines K A, draw the line M K, cutting the line A E at the point M. From the point M draw the line M J. This completes the pattern for one corner. Transfer the distance from A to M on the line E A to the lines E G, C H and B F, thus making the points N, O and P. Draw the lines N J, O J and P J. This completes the pattern without the allowance for the wire, which is indicated by the dotted lines.

If the reader should wish to look still further into the subject let him imagine that he has taken a square cornered piece of material the size of E F H G of Fig. 1, and that he has partially formed the pan, of which Fig. 4 would then be a

Fig. 3.—End View.

plan and Fig. 2 would represent one side. In this figure the line D C is the same as the line A B or D C of Fig. 1, and the line X X of Fig. 2 is the same as lines E F or G H of Fig. 1. The dotted lines A D and B C of Fig. 2 are the same as the lines A J, D J, C J and B J of Fig. 1. The triangular pieces X A D and B X C of Fig. 2 will be found to be identical in size with E J A of Fig. 1, or are the surplus stock to be turned around the end of the pan, as will be seen from an inspection of Fig. 4. This portion of the pan is double. Thus the whole of the stock between the points J E and J A has been ac-

Fig. 4.—View of Partially Formed Pan.

counted for in the triangle X A D of Fig. 2. Draw a diagram, A B C D, Fig. 3, which will represent the end of the pan. The line A D of this figure will be the same as A D of Fig. 2. Place

Fig. 3 is the same as the distance from A to M of Fig. 1. By this diagram I think the correspondent will readily see how the first method gives correct results.

From S. P., Sharon, Pa.—In the Letter Box I notice a request from "A. C.," Milwaukee, for a method of getting the corners of drip pan so that the corners will lay parallel with the wire. I would like to submit the following reply, and if any one can improve upon the method I would like to see it published. After obtaining the desired size and flare lay off on the miter line the depth of the pan finished and obtain the distance from that point to the flare line. Next carry the distance thus obtained along the end of the

Fig. 5.—Sketch Showing Method Suggested by "S. P."

pan, which will show where the corner will lay when finished. Measure from this point to the bottom of the pan at the corner. Lay off the distance on the miter line, which will be a little higher than the first space set off on the miter line. Cut from this point to the flare line, where the edge is turned over for the wire. I am only a young hand at the business, and perhaps some one can improve on my method or furnish a better one. If so, I wish he would do so. The sketch, Fig. 5, which I send, represents one corner of a pan with straight sides, but the plan will work on flaring ware just the same.

From D. W. McD., Westville, N. S.—In answer to "A. C.," Milwaukee, whose inquiry "How to lay off corners of drip pan?" appeared in *The Metal*

Fig. 6.—Sketch Accompanying Letter of "D. W. McD."

Worker of April 27, I would say that a simple way of doing the work is as follows: After marking off the depth and flare of the pan mark the depth of the notch for the wire, and then with a pair of dividers draw as shown in the sketch, Fig. 6, C, representing the bottom of the notch. Have A, C, A D and A E of the same height. This will allow the edges to lay parallel with the wire.

Kitchen Boiler Below Range.

From F. S. M., *Paulings, N. Y.*—In the Letter Box of *The Metal Worker* of May 11, "P. S. J." submits a sketch of a kitchen range with the boiler in the basement below, which fails to circulate properly and furnish hot water.

Kitchen Boiler Below Range.

he will run his pipes according to the plan herewith submitted, I think his trouble will be at an end. If the water front is not already tapped for 1-inch pipe, he should have it tapped for that size pipe, and run the flow and return pipes full 1 inch in size from the water front to the boiler. An air cock should be put on the highest point on the flow pipe, or better still, a $\frac{3}{4}$ inch bibb may be used instead, which will serve the purpose of the air cock and also furnish hot water as soon as the water front is heated. This is a job which is "agin' natur'," but if it is piped according to the plans, good results will be obtained.

From J. C., *Boston*.—In *The Metal Worker* of May 11 "P. S. J." asks why the water did not go down to the boiler when it was placed below the source of heat that was intended to apply to it. The answer is simply because it is in defiance of the laws of physics. As hot water is lighter than cold water, it will rise when free to do so. Water circulates because of the difference in the weight of the hot and cold particles of which it is composed; and for a hot water boiler to give the best results, every portion of it should be above the water back to which it is attached.

From G. F. S., *Washington, D. C.*—I notice the inquiry of "P. S. J." in *The Metal Worker* of May 11 and the communications answering it in *The Metal Worker* of May 18, giving suggestions how to start the circulation. If the plumber will put a T at the side connection to the boiler and will place a draw off cock at the side of the T he can start circulation by opening the cock and letting the hot water run down this pipe until it reaches the boiler, when the cock should be closed. After a circulation is started in this way it will continue as long as there is fire in the range. Every time that the fire is drawn the same method of starting the circulation would have to be followed. He will find in *The Metal Worker* of October 27, 1888, the illustration and description of a method of making water circulate two and three

stories below the fire. Another method of securing circulation in the right direction would be to place a check valve near the water back on the pipe which leads from the water back to the bottom of the boiler. There should be a pet cock placed on the pipe from the water back to the side of the boiler at the point where it turns down. This should be opened occasionally to let the air which would naturally accumulate in it escape.

From W. R. G., *Augusta, Maine*.—In *The Metal Worker* of May 11 "P. S. J." Jersey City, submits a sketch of a range boiler placed below the range, and wishes to know if such an arrangement can be made to work. The sketch herewith will show how it may be done. The hot water pipe, leaving the range, is carried 5 or 6 feet above it and then is carried directly down to top of boiler, the other connections remaining about the same as shown on "P. S. J.'s" sketch. It will improve the working of the job if the pipe which supplies the fixtures with hot water is taken off, as shown on sketch, through pipe marked *c*, but it is not necessary to do so, as the hot water pipe may be taken from pipe *d* anywhere from fitting *c* to top of boiler. If

Kitchen Boiler Below Range.

it is taken from pipe *d* it will be necessary to run a vent pipe from ell marked *a* to the tank which supplies the system. If that is not done the air will gather and prevent the water from circulating.

Sweeping Chimneys of Large Buildings.

From J. S. S., *New Jersey*—I wish to avail myself of the fund of information at the disposal of *The Metal Worker*, and ask for the most approved method of cleaning chimney flues, square and rectangular, averaging about 8 x 8 and 8 x 12. We have only cleaned flues on rare occasions, and then used fir boughs tied together and drawn through the flue. A figure is

asked for cleaning about 200 flues along with the general repainting of one of our large hotels.

Answer.—Those who make a special business of chimney cleaning provide themselves with brushes made of thin, flat steel wire. These brushes consist of a top and bottom loop of iron not over 5 inches long for attaching a rope, and from the center of this loop the thin steel wires radiate in every direction. Some use round brushes of different diameters and others have rectangular brushes of different dimensions. These are used in connection with a round iron ball and are lowered down from the top of the chimney, the ball being sufficiently heavy to pull the brush after it, and are operated by a man at the top of the chimney. Another man goes inside of the building and is provided with soot bags and canvases, so that grates, fire places and other openings in the chimney can be effectually stopped up, and the fine ashes and soot are caught in the bag and prevented from escaping into the rooms. Some ingenuity and skill may be displayed in the construction of the bags and other materials for stopping the flues. In some cases the flues are so crooked that the brush cannot be pulled to the bottom of the chimney by means of the ball weight. Then the ball is lowered from the top of the chimney, and on making its appearance at the bottom the ball is detached from the rope and the wire brush attached in its place, with the rope also attached to the loop on the under side of the brush. Then the flue is cleaned by drawing the brush up and down by the man at the bottom and the man at the top. In some of the large and elegantly furnished hotels of New York the flues to the grates in the apartments of some of their guests are cleaned while the guests are taking their morning drives, and the work is so carefully done that no effort is made to protect the furnishings beyond that which is made by the chimney sweeper, who only requires a short time to do the work.

Milky Water from Boiler.

From H. D. T., *Scranton, Pa.*—Will some of the readers of *The Metal Worker* explain why the water which comes from a boiler which has been in use about six years is milky looking when it is heated?

Enameled Well Points.

From J. ADDISON BROWN, *Riverhead, L. I.*—Can any of the readers of *The Metal Worker* inform me what firms in the Western country manufacture enameled well points; also in what places in New York State are they made?

Shipments of galvanized iron sheets from Great Britain to Australis, South Africa and the British East and West Indies, have shown a remarkable increase in volume during the past few months. The exports of this material to the places named have grown from 200 to 300 per cent., as compared with the average quantity exported in former years.

STEAM AND HOT WATER.

Combination Heating.

The following paper, by John Millar, was read before the Steam Fitters' Protective Association of Chicago:

I have been invited to speak to you to-night upon combination heating, that is, that system by which steam or hot water is used in connection with a hot air furnace, for the purpose of making it a more efficient system of heating.

Where and when this combination originated, I know not; perhaps the idea was first caught from the water front, or water back, used in ranges for a hot water supply for bath and cooking purposes, and adopted by some enterprising plumber or steam fitter, to heat a room in addition. However that may be, it is now one of the recognized systems of heating, as evidenced by the fact that nearly all manufacturers of hot air furnaces do not consider their line complete without a combination heater.

This being true, does the steam fitter consult his own interests in holding aloof from work of this description and allow the furnaceman to control this trade? For the steam fitter's part in the construction, or installing a combination plant, is as great if not greater than the furnaceman's.

Opposed by Steam Fitters.

I have had some years' experience in this class of heating, and I never met a steam fitter (except those interested and engaged in the work) who did not condemn combination heating, and generally in very forcible language.

It has always seemed to me a very foolish proceeding, for most of us can remember (and we have not to go back many years either) when the large majority of steam fitters spoke just as strongly against that now popular system, heating by hot water. There may be a few unregenerated steam fitters who have no faith in hot water heating, but I think they are hard to find. So will it be with combination heating; you will all fall in line some day and accept the inevitable, the onward march of the combination.

Does the steam fitter consult his own interests when he refuses to touch or countenance the usurper? For we must recognize the fact that there are people who have very decided opinions about the way in which their houses are to be heated, and these people sometimes get the idea into their heads that a combination system is what they require and will have nothing else.

A Demand to be Supplied.

You may call them "cranks," but if you do not supply them with what they want some one else will.

Heating men come across these people in their endeavors to get customers, and they are just cranky enough to ask for a combination and will not have anything else. They think that hot air heating is the best system and will not have any other. But their building cannot be heated successfully with hot air, and right here the combination

comes in to suit your customer's wants. You may try to make him believe that he does not need a combination, that he requires steam or hot water, but you may fail in the attempt and lose a prospective customer.

The questions now to be discussed are, what are the advantages of this system of heating, and how should the work be done?

Ventilation being considered necessary, in connection with the efficient heating of a house, and the knowledge that pure air is essential for that purpose, the problem confronting the architect or owner now is, "How shall I attain it at a moderate cost for heating and ventilating the building, with economy in fuel for the future?"

It Furnishes Ventilation.

The combination, by means of its hot air pipes and cold air inlets, furnishes the necessary quantity of pure warmed air, the hot water or steam being used to supplement the hot air by reaching rooms at a distance from the heater.

The same results are attained by a system of direct and indirect heating, with steam or hot water, but the difference in cost between the two systems is decidedly in favor of the combination, both as to first cost and economy in fuel.

This is the great advantage that the combination possesses over the hot water or steam systems, and one that is a consideration with many people.

One of the difficulties confronting the steam fitter in combination work is to know what furnace is best adapted for this class of work. Not having had any experience in hot air heating, he is ignorant of the requirements in a furnace to make it suitable for the purpose.

There are a large number of furnaces manufactured that are well adapted for this work. These are fitted with a hot water heater. They are of all shapes and sizes, and have ratings to carry from 75 to 1000 square feet of radiation. The majority of these hot water heaters are made of cast iron.

The Best Apparatus.

The combination furnace that will give the best results is that one whose hot water heater or steam heater is so constructed and placed in the furnace that it will, as little as possible, detract from its hot air heating power. That these heaters do reduce the hot air heating power of a furnace has been demonstrated beyond question, therefore this feature of the combination must not be overlooked, for if you expect that with a hot air furnace rated to warm 25,000 cubic feet of space you can add a heating boiler and warm 5000 to 10,000 cubic feet more space, you make a serious mistake. You must reduce the hot air heating capacity, and right here the difficulty presents itself as to how much should be cut off from the hot air.

A practical knowledge of the power of the furnace you are intending to use is the best and only guide to direct you, for the reason that some furnaces are

constructed with the hot water heating boiler either in the fire pot or as a part of the fire pot. This construction reduces the hot air heating power of the furnace considerably, and, if I had to use one of this construction and wanted to assure myself of a good working job, I would reduce the hot air to the full extent of the amount of cubic feet of space to be heated with hot water. For example, if a furnace is rated to warm 25,000 cubic feet of space without a hot water heater, and a hot water heater is attached that will heat 200 square feet of radiation, or about 5000 cubic feet of space, then I would reduce the hot air capacity by 5000 cubic feet.

The Proper Size.

When making calculations to warm a building with a furnace you must use the same judgment that would be used when estimating upon a hot water or steam job. That is, you would provide a heater that is rated to carry 25 per cent. more than the amount of radiation you propose to put on to it, and when I say that a furnace rated to warm 25,000 cubic feet may be used, I do not propose to put that size into a building containing that amount of space, but I would use the same judgment with a combination furnace that the practical steam fitter would use were he estimating upon a hot water or steam job; that is, to take a boiler rated for 20 to 25 per cent. more heating power than the quantity of radiation intended to be used.

There is another class of combinations, with the hot water heater so constructed that they are contained entirely within the combustion chamber. This construction does not reduce the hot air heating power of the furnace to the same extent that the first mentioned type of heater does.

This form of heater is suspended within the combustion chamber of the furnace, and is made in different shapes; some of cast iron and others constructed of steam pipe. You can readily see that with a hot water heater suspended in the combustion chamber, and in such a position that all parts of it receive the direct action of the heat, and it is entirely surrounded by burning gases, and at the same time does not come in contact with any part of the furnace that is radiating hot air, that it is the best, and the one that will give the best results with the least consumption of fuel.

Capacity of Water Heater.

The amount of radiation that a square foot of boiler surface will heat depends upon the grate surface, or size of the fire pot, and the position of the boiler in the furnace, and also its form of construction.

I have found that a boiler made of steam pipe, and so constructed and suspended in the combustion chamber of the furnace that it hangs close to the fire, will heat from 20 to 25 square feet of radiation for each square foot of boiler surface. You may require to use only one or two radiators on a large size furnace; now in such a case as this, you

will find that the proportion of boiler surface required for each square foot of radiation will be less than if, with a smaller furnace, you were intending to use a larger amount of radiation, so that with a small or medium size furnace and about 150 to 200 square feet of radiation, your hot water heater should have not less than 1 square foot of surface for each 20 feet of radiation. With a large size furnace and from 100 to 150 square feet of radiation, you will require a boiler with 1 square foot of surface for each 25 feet of radiation.

I am now speaking of a steam pipe form of hot water heater, having had some experience with that form of construction. The cast iron, or those that are supplied by the trade with the furnaces, are rated by the manufacturers of them, and you will have to take their ratings of the capacity of their boilers.

Piping a System.

The piping of a hot water or steam combination job is done in the same manner as the regular hot water or steam work. There has been a tendency upon the part of the manufacturers to make the tapping too small, and this has been the cause of many failures. The tapping should be the same for this class of work as would be used in a regular hot water job. This any steam fitter will readily see the force of, but I have seen heaters tapped $1\frac{1}{2}$ inches for three and four radiators, or about 150 square feet of radiation.

When one or two radiators only are connected to a combination heater do not use valves on them. They might be closed by some person not knowing what the results would be. When there are more radiators connected they may have valves, but I think it would be the safest plan to leave one or two without valves, leaving them off the radiators that are likely to be always in use—say a hall or bathroom radiator.

It is the practice in combination work to warm the rooms at a distance from the heater, or rooms that are difficult to warm, with the hot water, and the rooms near the furnace with hot air.

An Important Factor.

To properly install a combination in this way you will erect the hot water part of the system in the same manner as a hot water job. The hot air part would be done also in the regular way, but great care must be taken to have the hot water heater in the furnace the correct size for the amount of radiation connected to it. If it is too large for the amount of radiation attached, heavy firing to warm the rooms heated with the hot air will boil the water, making steam, and probably throw it out of the heater, causing annoyance and perhaps injury to the apparatus. This is one of the difficulties of combination work, it being necessary for a perfect working system that the hot air and hot water should be so balanced that a low fire or a heavy fire acts upon both evenly.

If the hot water heater is too small for the radiation attached, and requires heavy firing to attain the right degree of temperature, then it is possible, and often the case, that it makes that part of the house heated with hot air too warm, so that in one part of the house the temperature is raised too high, while that part in which the radiators are connected is at the temperature desired.

Its Varied Adaptability.

A combination is also well adapted for an old building, where it would be

difficult to run hot air pipes to the second floor without opening up the walls, the hot air registers being placed on the first floor and the radiators on the second floor. The hot water pipes in a case of this kind can be exposed in the rooms without disfiguring the walls.

When heating a building of this description and in the way described, you will naturally think that the plan suggested will be about half hot air and half hot water. You must not take that for granted, for there is always less radiation placed on the upper floors than is required on the first floor, for the reason that the heat ascending from the first floor assists in warming the upper rooms, and, as a combination system seldom has more than one-third of its heating capacity put into radiation, it is advisable to run at least one hot air pipe to the upper floor, but if this cannot be accomplished, owing to the construction of the walls, then I would place a large size hot air register in the first-floor hall. The heat from this register, ascending into the upper part of the building, will reduce the quantity of hot water radiation that would be necessary were you depending upon it entirely to warm the upper floor.

Another arrangement of the combination system is to place a register and radiator in the same room. This is necessary when it has large wall and glass surface, such as large bay windows, especially if they have a north or west exposure. In a room of this description it is a good plan to place a radiator at or near the extreme end of the room. The hot air register can be placed as near the furnace as possible. Now the question will arise in your mind, "How shall I proportion the quantities? How much radiation and what size hot air pipes will be necessary to warm this room?"

Rules for Hot Air Piping.

There are approximate rules of the size of pipes necessary to warm rooms with hot air by which furnacemen are guided. These rules, coupled with a practical knowledge of the conditions upon which they may be increased in size or decreased, are as follows for rooms on the first floor: An 8-inch pipe may be used for a room containing 1200 to 1500 cubic feet of space, provided the room has not more than one wall exposed and the pipe not more than 6 or 8 feet from the furnace. If the room has two or three exposed walls a 9-inch pipe would be necessary.

A 9 inch pipe for a room containing 1500 to 1800 cubic feet under favorable conditions. The same size room under unfavorable conditions, such as large wall and glass exposure and long distance from furnace, say 12 or 15 feet, will require a 10 inch pipe.

A 10-inch pipe for a room containing about 2000 cubic feet of space with two walls exposed and hot air pipe not longer than 8 or 10 feet, but under unfavorable conditions, such as long distance from furnace and large wall and glass exposure, same size room would require a 12-inch pipe.

Applying Rules.

These examples are given to show you that it is difficult to lay down a hard and fast rule that must, under all conditions, be observed for the size pipe required to heat a given space with hot air.

We all know that there are rules given by which the quantities of air passing through a pipe of a given size can be figured out. So also can the tem-

perature of the air and its velocity be calculated. A knowledge of these rules and how to figure them out is a good thing to have, but the furnaceman who depends upon figuring out the size of pipes necessary according to these rules will get sadly astray and will probably come to the conclusion that it is not always true that figures do not lie.

I have diverged somewhat to explain why an 8, 9 or 10 inch pipe will not always heat the same size room, and will now go on to tell you how I would arrive at the sizes necessary, when hot air and hot water heat is to be used in the same room.

Both Register and Radiator.

The room to be warmed, we will suppose, is 14 feet wide, 25 feet long and 10 feet high, containing 3500 cubic feet of space; it has a bay window and faces the north; it has two walls with outside exposure and is considered a room requiring a large appropriation of heat to warm it in severe cold weather.

If the furnace has large hot air duty to perform in other parts of the house, I would use, in this case, a 10-inch pipe, and as the hot air register is only about 5 feet from the furnace, it will warm, under these circumstances, 2500 cubic feet of the space of the room. I then take the balance of the space, which is 1000 cubic feet, and for hot water allow 1 square foot of radiation for each 20 cubic feet of space, which will be 50 square feet. This may seem to you a larger ratio than is usually allowed, but when you consider that this radiator has the cold air of a bay window with a large cooling surface surrounding it, you will readily understand the wisdom of providing plenty of radiation.

The General Conclusion.

It is the general practice to warm rooms at a distance from the heater with hot water, and the inner or central rooms with hot air, excepting in cases such as described, where it may be found necessary to use hot air and hot water in the same room, or to heat the first floor of an old building with hot air and the upper floor with hot water.

Hot water heat, in combination with hot air, being more in use than is steam in the same connection, I have based my calculations upon the hot water system. When steam is used, and it is often adopted in the same connection, the work is the same as far as the general principles are concerned.

Both systems, when properly and carefully adjusted, make efficient heating plants and are well worthy of your consideration.

THE FRONTIER IRON WORKS, Detroit, Mich., are issuing to the trade a 12-page catalogue of their Frontier and Weber Improved hot water radiator valves and union elbows. The first page is devoted to five different reasons why the Weber valves should be used. The next two pages show sectional views of their union radiator valves, which are made in two classes, self packing and not self packing. These goods are made of steam metal and in different styles, some being used for union connection and others are made for male and female connection. Two pages show their different styles of union elbows. A sectional view is presented of their new Detroit valve, which is of the union radiator character with soft metal packing. Cuts are also shown of Weber's composition corner gate and angle gate valves. The last page is devoted to a sectional view and description of Weber's

May 25, 1895

gate valves for steam and hot water, which are made of steam metal and in sizes from $\frac{1}{2}$ inch to 4 inches. These valves are made with either screw end or flange end.

New England and Excelsior Coil Boilers.

The illustration herewith shows the New England and Excelsior coil boilers, adapted for steam and hot water heating, and which are manufactured by the Springfield Coil Boiler Company, Springfield, Mass. The boiler consists of an upper and lower water chamber, connected by means of spiral wound coils of pipe. The coils are of pipe specially made for the purpose and said to be 25 per cent. heavier than standard and soft and flexible, so that the coils are formed without flattening the pipe or breaking it. The heaters are tested to 100 pounds hydraulic pressure before

The New England and Excelsior Coil Boilers.

leaving the factory. It is pointed out that by this construction a very large area of heating surface is exposed in proportion to the grate area. The water circulating through the boiler enters the spiral tubes at the bottom and passing through the coils is discharged into the upper chamber, and when used for steam the line of discharge is placed above the water line in the boiler. It is stated that when it is necessary to replace a coil the construction of the boiler is such that very little difficulty is experienced. Excellent opportunity for cleaning the coils is afforded by a door in the front which opens up and exposes all the piping, which is cleaned by means of a brush or by a jet of steam from the blow off when used as a steam heater. The boilers are equipped with a safety valve set to blow off at a maximum pressure of 10 pounds, also a damper regulator which will open and close the drafts at $\frac{1}{2}$ pound pressure. The boilers are made in different sizes to suit the requirements of the trade.

R. H. THOMAS, formerly manager and engineer for the Kelly & Jones Company, Chicago, has established a general steam fitting business at 16 North Canal street.

HEATING NOTES.

A PATENT has been allowed in both the United States and Canada to William H. Hallowell, Norristown, Pa., for a steam generating system for heating dwelling houses, the principal feature being a combination of a boiler with a range, either portable or brick set, the boiler being used for heating in the winter and disconnected in the summer. The heating boiler is fed with warm water from the regular range boiler.

THE CERTIFICATE of the incorporation of the Hersey-Atwood Heater Company of Clifton, N. J., has been filed at the County Clerk's office. The capital stock is \$50,000, all of which has been paid in. They will manufacture a vertical section steam and hot water boiler.

THE GOVERNOR on the engine at the works of the Standard Radiator Company, Buffalo, N. Y., was shattered by an accident resulting in a damage of \$1200, and a shut down of a few days for repairs.

A. J. CONNOR COMPANY have been incorporated at Chicago, with a capital stock of \$5000, to do a business of steam fitting and plumbing. The incorporators are Alban J. Connor, Edgar O. Stafford and John M. Van Duzen.

SECRETARY STEIN of the School Board of Grand Rapids, Mich., has been busy at work getting out a report regarding the heating apparatus and amount of coal used in the various schools of the city. Most of the 36 buildings are heated by steam heat or furnaces and only four of them still use stoves. As shown by the secretary's figures the average cost per room, regardless of the method of heating, is about \$30 a year.

H. A. R. DIETRICH, Bethlehem, Pa., the steam and hot water fitter, has added the tinsmith business to his plant and has just laid in a complete set of tools and stock of material. Under arrangements with a firm at North Wales, Montgomery County, Mr. Dietrich is turning out a large number of his patent safety boilers for house heating. The shop is now busy on orders from down East.

THE ELECTRIC BOILER COMPANY, Rochester, N. Y., are issuing a new 48-page catalogue of their Electric steam and hot water apparatus. A brief description is given of the different methods of heating and of the circulation of water. This is followed by an illustrated description of the construction and operation of their water tube boiler, which is shown both for steam and hot water heating. On page 20 an illustration is shown of their combined steam and hot water boiler, so arranged that a portion of the radiators in a heating plant may be heated by steam and others by a circulation of hot water. One page is devoted to an explanation and tables of a test of their steam boiler. Several pages are given up to tables of dimensions and ratings of the boilers for both steam and hot water and a complete telegraphic code. Many addresses of people in different sections of the United States who have used their boilers with satisfactory results are given.

THE MEMBERS of the American Society of Heating and Ventilating Engineers who are in attendance at the steam fitters' convention in Philadelphia in June are invited to meet in Room 11 Continental Hotel on June 13.

JACOB ESSIG, 35 John street, New York, makes a specialty of radiator decoration. He has been employed by the contracting steam fitters to decorate the radiators and the exposed heating mains in many of the largest heating plants that have been installed in New York City. His work can be seen in nearly all of the radiator showrooms in New York City.

F. A. SMITH of the W. H. Page Boiler Company, Norwich, Conn., is in charge of the New York office, at 61 Gold street, while Alexander Don, the manager, is making a business trip to Washington, D. C.

JOHNSON & MORRIS are issuing a card calling attention to the fact that the Street Department of New York has changed the name of South Fifth avenue to West Broadway, and that they are prepared to receive contracts for steam and hot water heating at their new address, 307-309 West Broadway.

Trade Notes.

THE POCKET PRICE-LIST of Milk Cans and Milk Can Stock issued by the Buhl Stamping Company of Detroit, Mich., has certain features of arrangement that will be highly appreciated by the trade. A series of numbers are made up in such a way that each number shows in itself what pattern and size of can the material is intended for, and also whether Can Trimmings, Can Stock or made up Can Stock are desired. By using these numbers, it is pointed out, long descriptions and consequent errors in ordering are avoided. Another new feature of the list is their cipher telegraphic code, which saves trouble and expense. The words are selected with special reference to the goods they refer to, as, for example, all the different sizes of "Baltimore" stock begin with "Ba," &c.

THE OLD DOMINION OIL CAN COMPANY have been formed at Richmond, Va., to manufacture a patent oil can. The incorporators are W. B. Saunders and R. W. Spillman of Richmond.

THE H. HALLER MFG. COMPANY, LIMITED, New Orleans, La., have established a Tinware factory, where they will carry on a manufacturing business on a considerable scale.

G. A. CROSBY & Co., 176 and 178 South Clinton street, Chicago, manufacturers of Dies, Presses and Can Makers' Machinery, have recently taken orders for nine of their large Can Soldering Machines, two of which go to England, two to Switzerland, one to Germany and the others to various parts of the United States.

J. P. LINDEMANN & SONS, Milwaukee, Wis., are sending out to the trade postal cards, on the back of which is an announcement relating to their well-known Acme Elbows. Reference is made to the Acme Corrugated, made from No. 26 patent finished black iron; the Patent Adjustable with double crimped seams; the Lindemann's No. 26, extra long, made from Wood's No. 26 smooth black iron, and also their regular grade of Elbows.

THE TOWNLEY METAL COMPANY, Kansas City, Mo., have decided to erect a warehouse 50 x 140 feet, four stories high. It will be built of pressed brick with stone trimmings and will be of slow burning construction. The cost will be about \$25,000.

PLUMBING and GAS FITTING.

Plumbers' Specialties.

The work done by plumbers may be divided into two classes with propriety. One class is constructing the water service and drainage system in buildings, and the other class is jobbing, placing new fixtures in an old system and attaching modern labor saving devices such as are being continually produced. The plumber has been called upon with a growing frequency to extend the gas service so that the cooking of the household may be done with the gas stove, and in a number of cases to attach gas grates and make arrangements so that rooms can be heated by gas used in portable stoves. Those who direct some attention to this special feature of their business have found it profitable.

When gas is used for cooking one of the drawbacks that is never lost sight of is the lack of a large supply of hot water, such as is furnished by the kitchen boiler when a coal range is used. There are a number of devices on the market which can be connected with the gas and water service for furnishing hot water instantaneously, and which have several advantages. There is no large volume of hot water stored to heat the apartment in which the storage tank or boiler would be placed, and gas is only burned in these devices while the water is being supplied, making a very material reduction in the quantity of gas consumed and the expense of heating the water. It is probable that the enterprising plumber who thoroughly acquaints himself with these different devices and their special merits can bring them before his customers in a very telling manner. The fact that there are always people who are looking forward to something that accomplishes what they wish inexpensively and promptly is sufficient reason for the plumber to make a push on this line. At this time throughout the country buildings are not sufficiently advanced to keep the plumber employed with new work, and at the beginning of hot weather the desirability of gas cooking appliances and some method of supplying hot water in unlimited quantities will be increased by the approaching heat. The plumber will do well to show some one of these devices in his shop and to canvass among his patrons for its sale.

THE DELEGATES ELECTED by the Master Plumbers' Association of Brooklyn, N. Y., to the annual convention of the National Association are: Thomas H. Radcliffe, Edwin Hayward, Geo. B.

Lewis, H. M. Noble, O. O. Sawkins, J. J. Keenan, J. W. Kelly, M. J. Gleason, M. Fallon, L. Haff, H. L. Potter, Wm. J. Gault, Bernard McBride, Geo. W. Smythe, C. F. Mentzinger, Thomas Kelly, E. McNamara and W. E. Williams.

The Golden Crown Combination Bath and Lavatory.

The Stuart & Peterson Company, Burlington, N. J., are putting on the market a new combination bathtub and washstand which they call the Golden Crown and which is shown in the accompanying illustration. The washstand feature is adapted for use in connection with their enameled bathtubs. It stands 14 inches high and is the width of the tub, with a depth of 9 inches. It contains shelves for sponges,

The Golden Crown Combination Bath and Lavatory.

brushes and other toilet articles, and incloses the supply pipes to the basin. The basin can be supplied of either enameled cast iron or of earthenware, and is 14 inches in diameter. It rests on a swivel acting waste pipe, so that it may be swung to one side out of the way when desired. Above the basin combination compression bibbs are placed for supplying the basin, or may be used for supplying the bathtub. The bathtub is also supplied with what is known as the secret supply under the control of a special bibb. It is stated that the combination bibb is located conveniently for filling pitchers. All the valves, couplings, fittings, pipes, cabinet and basin are fitted and furnished, so that only three joints are left for the plumber to make in setting the fixtures up for use. The average shipping weight for the fixture is about 325 pounds.

A California Ordinance.

The following is a plumbing ordinance recently adopted at Los Angeles, Cal.:

That section 1 of an ordinance, entitled "An ordinance adopting rules and regulations in regard to plumbing and house drainage in the city of Los Angeles," approved February 21, 1894,

be and the same is hereby amended to read as follows:

SECTION 1. It shall be unlawful for any person or persons to commence, do, execute, construct, carry on, conduct, assume control of, alter, repair, or add to any plumbing or house drainage affecting the sanitary condition of any house or building within the corporate limits of the city of Los Angeles without first having obtained a permit in writing from the Superintendent of Buildings of said city so to do. At the time of making application for such permit the person or persons making such application shall file with the said Superintendent of Buildings a plan or drawing and description of the work proposed to be done; provided that no such permit shall be issued or granted to any person by said Superintendent of Buildings, unless the work proposed shall be in accordance with the rules, regulations and requirements of the ordinances of said city of Los Angeles in force affecting, regulating and governing the proposed work; and provided, further, that no such

permit shall be issued or granted to any person until the fees hereinafter specified and provided for shall have first been paid and deposited with said Superintendent of Buildings. Upon such application being made and the payment of the fees hereinafter provided for, and upon the approval of the plans or drawing and description of said proposed work by said superintendent, said superintendent shall issue and grant a permit in writing to the person or persons making application to do said proposed work in accordance with and subject to the ordinances of said city of Los Angeles in force, and applying to, regulating and governing the proposed work.

The fees hereinbefore referred to and to be paid and deposited with the Superintendent of Buildings, as aforesaid, are hereby fixed and established as follows:

1. When the cost of the proposed work does not exceed \$35, the permit shall be granted free of charge.
2. When the cost of the proposed work is over \$25, and does not exceed \$50, the fee shall be 25 cents.
3. When the cost of the proposed work is over \$50, and does not exceed \$500, the fee shall be 50 cents; for each additional \$500 in the cost of proposed work, or fraction thereof, the fee shall be 50 cents additional.

SEC. 2. The City Clerk shall certify to the passage of this ordinance and cause it to be published once in the *Los Angeles Evening Express*, and thereupon and thereafter it shall take effect and be in force.

Connecting Fixtures.

From A. N. S., *New York*.—I would like to know what is the most general method of connecting basins and closets to iron pipe in large cities. It is safe to make the connections without using lead where the expansion and contraction is so great as it is in cold climates?

Note.—We shall be glad to have our plumbing readers give their views on this subject, but in order that our correspondent may have some information we make the following suggestions: Where the drainage system is of the screw joint, wrought iron pipe character, it is not uncommon to connect the brass traps from basins directly into the iron pipe. There are some fittings made for waste pipes that may be calked directly into the cast iron soil pipe. The majority of water closets used in high grade plumbing are of earthen ware with trap complete in them, and, as a rule, they are connected with the pipe by means of a lead bend. Some of the hopper closets which have a cast iron base have various kinds of cast iron S traps made as a part of them, and these connect with iron pipe which runs directly to the soil pipe without serious trouble resulting. It is probable that the change of a high stack of cast iron soil pipe from its length in the winter season to the expanded length of the summer would make some trouble if the fixtures were rigidly connected with it, and under such circumstances a lead connection would certainly be of advantage.

Soldering with Cast Iron.

The plumber for all his skill in joint wiping will find his handicraft surpassed by a piece of Chinese practice in mending cracked cast iron vessels. The following account of their work is given by Dr. Ludwig Beck, an eminent authority, in his "History of Iron:—

The Chinese are exceedingly skillful in casting iron. They know how to cast astonishingly thin objects. Their pots for cooking rice in are of cast iron and are very thin. If one cracks or is burned through it is not thrown away. The traveling tinker understands how to mend these pots perfectly. First he files the crack or hole and grinds the portion smooth with a piece of a brick. Then he puts some pig iron into a crucible of the size of a tumbler. This crucible is heated in a small oven, which is 5½ inches in diameter and about as high. At the bottom is a grate through which the blast enters. When the iron is fluid he pours it on a piece of felt which he holds in his left hand, and presses the molten metal on the inside of the pot against the place to be mended. The metal which oozes out through the crack or hole is smoothed over with another piece of felt in his right hand. The felt is covered with ashes or dust. This operation he re-

peats until the pot is mended and holds water. The charge for mending a pot is 8 cents.

Local Associations.

MASSACHUSETTS PLUMBERS.

The second annual convention of the Massachusetts Association of Master Plumbers was held in New Bedford last week. William H. Mitchell of Boston, the president, called the meeting to order shortly after 11 o'clock, and after a brief address of welcome T. J. Tute of Boston was appointed sergeant-at-arms for the occasion. J. K. Tully and J. McCoolle of Boston and H. A. Desper of Worcester were appointed a Committee on Credentials. The committee reported the following as present:

Boston: T. G. Tute, D. G. Finnerty, William H. Mitchell, J. W. French, W. H. French, J. W. Coaden, E. C. Kelley, J. C. Kelley, C. M. Brownwich, H. H. Collins, J. C. McCoolle, J. S. Boyd, N. Tucker, M. Keane, P. J. Dugan, D. Horgan, W. McKenna, T. E. Dwyer, P. W. Hayes, D. F. Hurley, J. L. Connell, T. E. Sharp, H. Carruthers, A. Curtin, J. F. Davlin, J. T. Desberry, H. P. Donnell, Daniel Shannon, P. J. Hoyt, Isaac Riley, William Lumb, Edward Milla, David Craig, Thomas H. Naughton, J. K. Tully, D. F. Hurley.

New Bedford: J. W. Coggeshall, George F. Maxfield, T. J. Gifford, T. E. Mahoney, E. A. Higgins, E. F. Penney, John Ryan, John D. Elliot, D. A. Harrington, Frank C. Smith, J. W. Clifton, J. R. Denham, Charles P. Maxfield, J. H. Mahoney.

Fairhaven: R. H. Taber.

Malden: A. A. West, C. A. Driscoll, Mr. McDonald.

Revere: J. J. Lyrcome.

Springfield: J. W. Kennel.

Worcester: J. F. Deedy, J. Jordan, H. A. Desper, A. A. McLaughlin, O. S. Kendall, J. W. Greene.

Marlboro: William H. Hill.

Holyoke: C. P. Lyman.

Dorchester: T. J. Kenney.

Fall River: R. E. Fogwell, William H. Durfee.

Haverhill: A. W. Cram.

Cottage City: F. D. Tripp.

Canton: George H. Beasley.

Wakefield: Thomas E. Dwyer.

John Reagan, inspector of plumbing at Boston, was present as a guest of the association.

A resolution of thanks was adopted complimenting D. G. Finnerty of Boston for the part he had taken in defending the plumbing law. A banquet was served at noon, at which Mayor Parker and members of the New Bedford Board of Health were present and made speeches. Business was resumed in the afternoon. J. F. Davlin thought something ought to be done with the resolution extending the scope of the National Association by affiliating with the craft in Canada, and a motion that it be the sentiment of the association that such a resolution be adopted was unanimously carried.

The following officers were elected:

President, William H. Mitchell of Boston.

Vice President, J. W. Greene of Worcester.

Recording Secretary, Daniel Shannon of Boston.

Financial Secretary, C. P. Lyman of Holyoke.

Treasurer, Isaac Riley of Boston.

Executive Committee, J. F. Davlin of Somerville, O. S. Kendall of Worcester, J. W. French of Boston, T. J. Gifford

of New Bedford, and D. G. Finnerty of Boston.

Isaac Riley of Boston and R. E. Fogwell of this city were elected delegates to the National Convention.

KANSAS PLUMBERS.

The tenth annual convention of the Master Plumbers' Mutual Benefit Association of the State of Kansas was held at German League Hall, on Kansas avenue, near Third street, Topeka, last week. There were 23 of the 31 members of the association in attendance, and the time of the sessions was occupied in discussing sanitary methods and other subjects connected with the trade. The election of officers for the ensuing year resulted as follows:

President, G. W. Searles of Atchinson.

Vice-President, M. Dermody of Wichita.

Secretary, F. W. Doane of Lawrence.

Treasurer, F. H. Bowers of Emporia.

Sergeant-at-Arms, Matt. Whitson of Salina.

Delegates to National Convention, D. W. Searles, *ex officio*, F. H. Bowers of Emporia, C. J. Prescott of Topeka, James Foley of Leavenworth and James Savage of Lawrence.

Among the delegates present at the State convention were:

Atchinson: G. W. Searles and Alex S. Bowen.

Concordia: Mr. Belisle of the firm of Groesbeck & Belisle.

Emporia: F. H. Bowers.

Hutchinson: C. C. Stewart.

Lawrence: F. W. Doane and George Savage.

Leavenworth: James Foley.

Topeka: A. H. Nooney, Robt. Mood, Christian States, John Sheehan, C. J. Prescott and A. Allen.

Wichita: M. Dermody, P. H. Bertram, J. W. Green and J. A. Williams.

BALTIMORE PLUMBERS.

The annual meeting of the Master Plumbers' Association of Baltimore, Md., was held last week at the Builders' Exchange. The following officers were elected:

President, H. C. Bowman.

Vice Presidents, P. T. Barry, August Eldman, J. F. P. Carey.

Secretaries, G. W. Addison and C. H. Frederick.

Treasurer, D. N. Sullivan.

Sergeant at Arms, Michael Lots.

Directors, George Knipp, A. Stidham, P. T. Barry, T. B. Hibbits and P. A. Sullivan.

Delegates were elected to represent the Baltimore Association at the national convention, as follows: H. C. Bowman, John Trainor, J. F. Carey, G. R. Minnick, D. J. Barry, J. C. Mitchell, George Knipp, P. A. Sullivan and James Trainor.

TEXAS PLUMBERS.

The Texas State Association of Master Plumbers met at Austin last week in annual session and reviewed the association's workings for the past year. The following officers were elected for the ensuing year:

President, B. F. Sullivan of Dallas.

Vice-President, J. S. Brazelton of Waco.

Secretary, George Mummert of Dallas.

Treasurer, D. J. May of Galveston.

Sergeant-at-Arms, George A. Brush of Austin.

Executive Committee.—E. A. Thomas

of Waco, G. W. Prewitt and G. D. Ackley of Fort Worth.

Delegates selected to the national convention at Philadelphia were B. F. Sullivan of Dallas, J. M. Shumate and A. H. Shafer of San Antonio, D. G. May and Paul Shean of Galveston. W. W. Otter of Houston was selected to go before the national convention for vice-president.

There were some 75 delegates present, representing every section of the State. Among those present were: Ed. Braden, Jr., A. H. Shafer, John Bowman, Morgan & Co., J. C. Marquant, Wm. C. Shurwirth, all of San Antonio; J. F. Osborne, J. B. Austin of Askley, and Geo. W. Prewitt of Fort Worth; W. A. Burke, G. A. Brush, A. L. Teagarden and Jos. Schumate of Austin; W. W. Otter and R. B. Morris of Houston; T. J. Kirk, D. G. May, W. L. Rattislan and Paul Shean of Galveston; F. S. Brooks of Corsicana; B. Kahn, F. A. Campbell, S. C. Carroll, E. S. Davis, Geo. Mummert and D. F. Sullivan of Dallas.

The convention decided to invite the national convention to visit Texas next year. The association adjourned, to meet in Waco next May.

MAINE PLUMBERS.

The Maine State Association of Master Plumbers perfected its organization at a meeting held at Portland last week by the election of the following officers:

President, John B. Smith of Lewiston.

First Vice-President, William J. Miller of Portland.

Second Vice-President, John Witley of Gardiner.

Secretary, J. E. Chamberlain of Bangor.

Treasurer, L. W. Haskell of Auburn. *Sergeant-at-Arms*, George Getchell of Bangor.

THE INSTANTANEOUS WATER HEATING COMPANY, Chicago, with New York office at 838 Broadway, emphasize the need of ventilation by printing in red at the side of their letter heads, "It is absolutely necessary that each heater should be connected with a vent pipe terminating outside of the bathroom in which the heater is connected." The necessity of this course will be apparent when any one considers the conditions of the case. A bathroom is usually a very small apartment, and too often, especially in old houses, there are no means of ventilation except a window. During bathing this is almost always kept closed tight, and the result of a large gas flame under a hot water heater is to vitiate the air very rapidly. To support the combustion the oxygen is taken out of the air and in its place there is a large supply of carbonic acid coming out of the heater. It is reported that a young girl met her death recently in San Francisco through suffocation due this very cause, the bathroom having had an old fashioned heater in it.

THROUGH the courtesy of S. E. Dibble, we are informed that at the last special meeting of the New Haven Master Plumbers' Association the following delegates were elected to attend the national convention at Philadelphia: President F. A. Curtiss, W. H. Hazel, Wm. Keane; alternates, S. E. Dibble and Andrew J. Clerkin.

E. C. WHEELER, formerly of Dalton, has started in the plumbing business at Watertown, Mass.

The Defender Ventilating Siphon Closet.

The Newell-Booth Company, Ltd., 447-451 North Broad street, Philadelphia, are putting on the market the closet shown in the accompanying illustration.

As will be seen, no overhead tank is used, the flush being supplied from a cistern laid flat against a wall or other support, and attached directly to the bowl. The combination occupies little room, no larger space in fact than that necessary for an ordinary high backed chair. It can be set and will work perfectly, it is stated, in an alcove, or under a stairway, or may be set in the place of an old closet without additional plumbing work.

The construction is simple, there being very few working parts. The bowl is formed with two traps, the lowest trap being the deepest, and is designed particularly to facilitate ventilation and afford double security

The Defender Ventilating Siphon Closet.

against the return of foul air. By means of a ventilating ball valve located in the back of the closet the foul air is permitted to pass up into the cistern, and a similar valve allows of the air being discharged from the cistern to the soil pipe by way of a duct or passage formed in the side of the bowl and extending to and connected with the soil pipe below the traps. The flush is obtained by pressing the knob seen at the left lower edge of the cistern. While the flush is being made the lowering of the water in the tank causes a suction from the air space between the two traps, drawing the water and soil from the upper trap and the foul air from the face of the bowl. While the water and soil fall into the waste pipe below the foul air is drawn up through the ventilating valves into the upper part of the tank; then, as the tank automatically refills, the water pressure forces the foul air down, lifts the ventilating discharge valve and passes into the soil pipe. In this manner all ventilating pipes are done away with.

The cisterns are furnished in both plain and ornamental designs, and the closet, when complete, occupies a floor

space 26 x 18 inches, with an elevation of 5 feet. The cisterns and seats are handsomely finished, and are furnished in oak, walnut or cherry, or any other wood required. The makers say that the closet is not an experiment but the result of years of study, and they fully guarantee it to be what they claim.

TRAPS AND VENTS.

THE MAYOR of Milwaukee, Wis., has vetoed an ordinance which came to him with the view, it is said, of making the office of plumbing inspector subject to political influence.

C. T. LAMSON, Elizabethtown, N. J., has secured the services of T. Frank Clark and is going to do plumbing, steam and hot water and gas fitting. Mr. Lamson requests that manufacturers and dealers furnish him circulars and price-lists relating to goods for the steam, hot water and gas fitting trades.

C. A. MAYNARD has moved to his new store, 92 North Main street, Pawtucket, R. I., and will do plumbing, steam and gas fitting in all its branches.

FRANK S. KOMP, 53 Dearborn street, and Clayton & Clausen, 208 Armitage avenue, have recently started plumbing establishments in Chicago.

CHARLES T. TARPENNING, Xenia, Ohio, has recently patented a gasoline furnace in which the flames strike together in the center, thereby producing an intense heat. The arrangement of parts is such that the heat is retained within a small compass, and when the soldering tools are in place they are heated from all sides. The frame in which the burner is located is so constructed as to prevent a draft through the heating chamber, while the needle point is so protected as to prevent deflection of the gas. The burner is supported directly on the tank and the tool support is arranged at the open side of the heating chamber.

DANIEL HALLORAN has been granted a master plumber's certificate at Kingston, N. Y.

WESTERN PLUMBING SUPPLY COMPANY have been incorporated at Chicago, with a capital stock of \$3000. The incorporators are M. Naughton, George E. Marshall and C. Carpenter.

THE NEW ORDINANCE regulating the fees to be paid the city of Los Angeles, Cal., for plumbing went into effect last week. Under its provisions all permits for work for \$25 or less are issued free; work costing from \$25 to \$50 must pay a tax of 25 cents; from \$50 to \$500, 50 cents, and for work costing over \$500, 50 cents for each \$500 and fraction thereof. The total value of the cost of plumbing work for which permits were issued on the first day was \$2721.50. The permits issued numbered 13 and they paid into the city treasury the sum of \$10.50.

MICHAEL WYNNE, who recently succeeded to the plumbing and gas fitting business of James Daly, at 907 Sixth avenue, is busy at repair work.

THE plumbing and gas fitting establishment of Perry Waite, at 239 Superior street, Toledo, Ohio, has changed hands, T. Gaffney and Robt. P. O'Grady having purchased the outfit.

EAST RIVER LEAD COMPANY, 523 and 525 East Nineteenth street, New York, report a very gratifying expansion in the demand for lead pipe. Their works are now running to their fullest capacity, with a larger amount of orders on their books than for two years past.

THE TIN SHOP.

Pattern for Irregular Flaring Shape Forming a Transition from a Round Horizontal Base to a Round Top Placed Vertically.

From D. W. PHILLIPS, Baltimore, Md.—The article published in *The Metal Worker* for November 24, 1894,

method in detail. The engravings here presented are reproductions of his sketches, save that the proportions are varied to conform to those of the problem printed in *The Metal Worker* of November 24, 1894. We give a demonstration which will be readily understood by all. Referring to the

the side, below which is drawn the plan showing its circular base, J K L M. The line N P shows the plan of the opening D E F G, which opening is shown in the side view by that portion of the line A B from A to Q. Opposite the front side of the plan N P is drawn a duplicate of the profile D E F G, as shown by E' F' G', so placed that its vertical center line E' G' shall coincide with the center line of the plan, as shown. As the article consists of two symmetrical halves it will only be necessary to develop one-half the complete pattern. Therefore divide one-half of both profiles E F G and E' F' G' into the same number of equal parts, numbering each in the same order, as shown by the small figures; also divide the plan of the base into the same number of equal parts as the profile, numbering the points to correspond with the same. Drop lines from the points on the profile E' F' G' onto the line N P, at right angles to the same, as shown, and connect these points with those of similar number upon the plan of base by solid lines, as shown. Also connect points upon the base with those of the next higher number upon the line N P by dotted lines.

It will be noticed that the point J of the plan represents at once the point 1 of the base, and the points 1 and 7 of the profile, shown by B, Q and A of the side elevation. These lines drawn across the plan represent the horizontal distances between the points which they connect and will form the bases of a series of right angled triangles, whose altitudes can be derived from the elevations, as will be shown, and whose hypotenuses, when drawn, will give the true distances between points of corresponding number across the finished article or its pattern. To obtain the

Pattern for an Irregular Flaring Shape Forming a Transition from a Round Horizontal Base to a Round Top Placed Vertically.—Fig. 1.—Front and Side Elevations, Profile and Plan of Article.

in answer to the request of "H. J. S.," Appleton, Wis., is not what you or he intended it. In other words, if the directions are followed with the diagrams as a guide there cannot be developed a pattern for the shape intended. I send some drawings which I shall be glad to have published for the benefit of the subscribers of the paper who have asked me to put them straight on this thing.

Note.—Our correspondent is assuming too much when he intimates that the article published in our issue for November 24 is not what we intended it to be. We take this opportunity of stating that the solution of the problem there given is correct in all respects, although it may be a little too complicated for ready comprehension, hence the perplexity of our correspondent. The sketches which he sends show a solution of the problem by a simpler method than that published, but he fails to furnish a demonstration of the

illustrations, let I D E F H represent the front elevation of the article, showing the circular opening D E F G form-

Fig. 2.—Diagram of Triangles.

ing its upper perimeter or profile. The triangle A B C shows the shape of the article as it appears when viewed from

altitudes of the triangles carry lines from the points in the half profile E F G horizontally across, cutting the

line A Q, as shown; then the distances of the points in A Q from B will constitute the respective altitudes of the triangles. Therefore, to construct a diagram of all the triangles, draw any horizontal line, as B C, Fig. 2, near the center of which erect a perpendicular, B A. Upon B A set off from B the various distances from B to points in A Q of Fig. 1, numbering the same as shown by the small figures. From B set off on B C the lengths of the various solid lines drawn across the plan, Fig. 1, and connect points in B C with those of like number in B A. From B set off toward D the lengths of the various dotted lines drawn across the plan in Fig. 1 and connect them by

Fig. 3 as center, with a radius equal to 7 6 of the profile, Fig. 1, describe a small arc, which intersect with another struck from point 6 of pattern as center, with a radius equal to the solid line 6 6 of Fig. 2, thus locating the position of the point 6' of the pattern.

So continue to use the spaces of the plan, the lengths, the dotted lines of the diagram of triangles, the spaces in the profile and the lengths of the solid lines of the diagram of triangles in the order named until all have been used and the pattern is complete. Lines traced through the numbered points obtained as shown from C to B and from A to Q will form the outlines of the pattern for half the article. The other

above pipe laying was all that called workmen out of the shop. Tools and machines have not greatly changed, the "must haves" being for turning, wiring, burring, folding and grooving. The old folder had two levers, a horizontal and a vertical; the first was lifted by the left hand and the tin pushed up to gauge by the right hand. Dropping the same lever made part of the fold and it was completed by two movements of the vertical lever with the right hand.

The stakes have retained their old names, which in some cases are now misnomers; the blow horn stake is common, but the old tin horn, without a reed, has departed; the needle case stake has also changed its business, the use of the creasing stake has a good deal decreased, and the hand swage is superannuated. The raising block, with its peculiar hammers, was indispensable, for every concave article was raised by repeated blows of the round faced hammer in a suitable cavity. Everything was cut with the bench shears. "Snips," so called, were little used at the bench. Hammers and mallets were as now. Among the tin fabrics of former time which have now gone into "innocuous desuetude" were whistles, formed of two small disks with central holes and connected by a narrow band; these, with $\frac{1}{2}$ pint cups, were the cause of many burned fingers in the apprentices' first lessons in soldering. Needle cases for holding the slender steel rods on which grandmothers used to build up stockings, are only relics with the present woman, for she knits not hosiery, neither does she spin. The round tin lantern with its conical top, which was hand punched with fanciful apertures to let the candle light strain through, has gone out, or may still live in economical households as a horse-radish grater. Candle molds, pepper boxes, molasses cups, with other ware of the old time shop, are now "down among the dead men."

I will take as a specimen of the work of our ancestors the making of a tea kettle. The body, spout and handle were marked out by a pattern, the top and cover also scribed on the flat sheet with compasses. The copper pit, deeper then than now, was a pieced pan whose flange was formed with the hammer and mallet; wash boiler pits, which were twins of the kettle family, were also thus made. Our tea kettle next went through the various stages of cutting out, raising the top and cover, forming, double seaming and soldering. The forming or shaping of many cylindrical vessels was done on tapering or straight wooden logs upon which the workman sat astride. Spouts and handles were formed on the blow horn stake. Ears were made on the creasing stake, and I may say that every component of tinware, except perhaps the rivets, was made in the shop, for trimmings were not to be bought. There was a home-made former for stove pipe of two wood rolls, in which by the use of a lever and mallet it could be partly shaped and the lock turned. After the lock was closed on a mandrel the pipe went to the beak horn stake, where by holding the seam parallel and close to the edge of the stake it was grooved without a groover and left smooth on the outside. I have not space for the old shop lore that comes to mind, and my contemporary fossils might add to the interest no doubt, but this "looking backward" may serve to show the operations of the former metal worker, and possibly help his successors to appreciate their modern improvements.

Fig. 3.—Pattern of Article.

dotted lines with points of the next higher number in the line B A, all as shown; then these various hypotenuses will constitute the true distances across the finished article between points of corresponding number indicated on the plan and elevations. The distances between points in the base line forming the larger or outer curve of the pattern can be measured from the base line in plan, while spaces forming the upper or shorter side of pattern can be measured from either of the profiles.

To develop the pattern it is simply necessary to construct the various triangles whose dimensions have been obtained in the previous operations, beginning at either end most convenient and using the dimensions in the order in which they occur until all have been used and the pattern is complete.

Therefore, upon any straight line, as A C of Fig. 3, set off a distance equal to A C of Figs. 1 and 2 or the solid line 7 7 of Fig. 2. From C as a center, with a radius equal to 7 6 of the plan, Fig. 1, describe a small arc to the left, which intersect with another small arc struck from A as a center and with a radius equal to the dotted line 7 6 of the diagram of triangles, Fig. 2, thus establishing the position of the point 6 of the pattern. From A of

half, A Q' B' C, can be obtained by any means of duplication most convenient.

A Country Tin Shop Fifty Years Ago.

BY FOSSIL.

Probably there are some now in the trade who will recognize the pen picture which I will attempt to make and compare it—perhaps unfavorably—with their own experience, but as this writing is intended for those of a later generation who may like to contrast the then and now, any comments or criticisms which it incites may be interesting. A suburban tin shop in the forties was just what its name implies, for but little other material was used or product made except that which came under the general term tinware. Sheet copper, brass, zinc and iron (not galvanized), English and Russia, were to be had—American was not then much, if any, in the market. Nearly all the shop output was utensils for domestic use, some of which are now obsolete. An occasional job of roofing was done with 10 x 14 bright plates. Also in the locality where the shop I describe was situated there were various things for cotton mill work to be made to order. There were, to be sure, such outside jobs as the laying of lead pipe for water supply, with its accompaniments. This was not called plumbing, and wiped joints were almost unknown. The putting up of gutters and leaders with

Goulds' Electric Triplex Pump and Belt Tightener.

In modern pumping operations electricity has come to play an important part and pumps electrically operated are now a common sight. Such an installation is simple in operation and practically automatic. It is not at-

and which is adjusted by a set screw with lever handle. This pumping outfit is designed for use in dwellings, business blocks and country houses, while the larger sizes are employed for all kinds of pumping service.

A dispatch from Shanghai, China, asserts that one advantage which may be gained as a consequence of the late

Out-Ferrising Ferris.

In the mammoth Watkin Tower, now being constructed at Wembley Park, a suburb of London, the English propose to place in the shade the wonderful structure of Eiffel, in Paris. Similarly they have just "gone one better" in the matter of "Ferris wheels." For several months past there has been rising in the exhibition grounds at Earl's Court, near London, a steel structure 300 feet high. This is a gigantic wheel, which is an enlargement on and a modification of the wheel which attracted so much attention at the Columbian Exposition. The English structure, which was opened to the public this week, is the largest thing of its kind ever built, the axle being carried on eight supporting columns 150 feet high, at which level there are two promenades, or recreation roads, communicating with each other by a passageway through the axle 7 feet in diameter. Around the periphery are suspended at intervals on steel shafts, 40 cars, 24 feet long by 9 feet wide and 10 feet high, each car being capable of carrying 36 passengers. Ten of these cars have been elegantly furnished and form first-class cars, the remaining 30 being finished in a plainer style. As the wheel revolves, passengers are able to obtain, in clear weather, a magnificent view of London and the surrounding country. Access to the promenade at the top of the columns forming the towers which carry the wheel is gained by a double funicular railway, or water balanced elevators. At night the wheel is lighted by electricity. The total weight of the wheel and cars is about 1500 tons. The wheel was planned by Lieut. J. W. Graydon and built by Walter B. Basset.

The subordinate bodies of the Iron Molders' International Union have decided to hold a convention in Chicago,

tended with any noise or dirt; it requires no skilled attendance and may be employed in many instances where the use of other motive power would be undesirable. One of the most important features of such an equipment is the fact that the moment it is shut down the expense of operating ceases, and the motor and pump may be run continuously or intermittently, as may be desired. The subjects of the illustrations are Goulds' triplex power pumps operated by an electric motor, and a pump and motor mounted on one base, together with a belt tightener. The pump is the well-known triplex pattern built by the Goulds Mfg. Company of Seneca Falls, N. Y. The principle on which the pump is built is that a constant flow and consequent high efficiency are produced by the constant action of parts. As will be seen by the cuts, this style of pump has three plungers set at 120° on the crank and which by their following and overlapping produce a constant and uniform flow of the liquid pumped. Fig. 1, as ordinarily built, has three single-acting plungers and connecting rods, to which the plungers are attached by means of cross heads which sustain the side thrust of the connecting rods and permit the plungers to operate without lateral pressure. The plungers are outside packed and have water seal. The valves are rubber disks with bronze trimmings and seats.

Both the engravings, Figs. 1 and 2, show the arrangement for driving these pumps by electric motor. Fig. 2 illustrates the Goulds belt tightener, which is intended for use where pump and motor are in close proximity and which prevents the belt slipping, and thereby insures the satisfactory operation of the pumps. It consists of an arm with hinged extension, the former being belted securely to the frame of the pump. The arm carries an idler pulley which is flanged to prevent the belt running off

war is the opening up of the natural mineral wealth of China. The coal famine, which was caused by the war, has caused a careful prospecting of the country for signs of coal, with the result that beds of good bituminous coal, easily workable, are said to have been discovered on the Yangtze River. Ap-

Fig. 2.—Goulds' Pump Belt Tightener.

plication has been made for a concession to work the mines, and it is hoped that before long the industry will be in full swing. It is believed that if the coal deposits on the upper Yangtze are successfully worked it will be a step toward opening up the rich mines of coal, silver and other minerals which are known to exist not far from that neighborhood.

opening on July 8. As this will be the first convention of this body that has been held in four years, much interest is felt in it by the workmen.

The Henry McShane Mfg. Company, Baltimore, Md., employing about 1000 men, have advanced wages 10 per cent.

TIN PLATES.

Domestic Tin Plate Works Busy.

In line with the steady improvement which has developed in the condition of general business throughout the country, the demand for tin andterne plates, after a spell of depression extending over nearly two years, has begun to show a very gratifying expansion. Reports from all quarters indicate that the requirements of consumers are growing week by week, and this improvement is fully reflected in the great degree of activity which now prevails among the American tin plate works. Most of the large plants in the Western, Ohio and Pittsburgh districts are reported as running to their limit of capacity to fill the orders on their books, and several of them are referred to as being behind their orders. The fact that so many of their Welsh competitors have lately been forced either to shut down altogether or to reduce the extent of their output gives the American manufacturers the opportunity of placing their material on the market under the most favorable circumstances. Stocks of foreign plates have run very low, and in some lines are almost unobtainable just now.

The lack is being filled by plates manufactured in this country, and it is confidently expected by the domestic makers that once consumers, hitherto accustomed to use only the imported material, have been able to make a thorough test of the American plates in actual service, and having compared them with the Welsh product, they will not readily revert to their old love. The price of American plates has been brought down to very nearly, if not quite, the level of imported brands of the same quality, and the advantages offered by the former in the way of ready shipment, freshness of stock and the facility of returning damaged goods or any not found up to standard cannot fail to be duly appreciated by the consuming public. The fact that the standard of American made plates has been generally maintained hitherto at a high level of excellence holds promise that the expectations of their steady growth in favor will not be disappointed, provided the keen competition which is more than likely to occur before very long in this as in all other lines of iron and steel manufacture does not bring about deterioration in the quality.

The marvelous growth of the American tin plate manufacture in less than four years presents one of the most re-

markable instances of industrial effort in history. From nothing, it has become an established industry of large proportions, which already gives employment to some 15,000 hands. At the present moment, so far as can be gathered from the latest reports, there are in actual operation 28 tin plate works proper, rolling their own black plates. Ten more are building, two or three of which are practically complete and ready to start up, while the majority of the other are expected to be in operation by July 1. These works possess an aggregate of 155 mills completed or building, of which about 110 are now in active work. In addition to these works there are no less than 30 plants now actively employed where black plates, purchased from American mills, are dipped and finished for the market. Five other works of a similar character are idle and two new ones are building, some of these "dipperies" representing a very large capacity of production. Already the possible output of all the tin plate works in the United States nearly approaches the average total consumption of the country, exclusive of that portion, amounting to from 1,200,000 to 1,500,000 boxes per annum, on which a drawback of duty is allowed for re-export, or which, like the Pacific Coast trade, cannot yet be touched by the home manufacturers on account of freight.

Meeting of Sheet Manufacturers.

The regular monthly meeting of the Iron and Steel Sheet Manufacturers' Association was held in the Conestoga Building, Pittsburgh, on Tuesday, the 21st inst. J. G. Battelle of the Piqua Rolling Mill Company of Piqua, Ohio, was in the chair and John Jarrett was secretary. After routine business had been disposed of the wage question came up and was under discussion for considerable time. It is generally expected by the members that the Amalgamated Association will ask an advance in wages of not less than 10 per cent., to go into effect on the expiration of the present scale on June 30. It will be remembered that when the Amalgamated Association reduced the base price of bar iron from 2 cents to 1½ cents it carried with it a reduction of 10 per cent. in the sheet scale. It is more than likely that the employees will demand that this 10 per cent. be restored, and, if such is the case, it is certain that the advance will be refused. It can be authoritatively stated that the sheet manufacturers will agree to sign the present scale for another year, only asking the same slight modifications in the foot notes. A number of concerns who are members of the Iron and Steel Sheet Manufacturers' Association are

also members of the Tinned Plate Manufacturers' Association, and on Thursday evening an informal conference of the representatives of these concerns was held in the Monongahela House, Pittsburgh. The wage question was gone over pretty thoroughly, but nothing definite was done, or can be done, until the result of the convention of the Amalgamated Association, now in session at Cleveland, Ohio, is known. It will be remembered that on October 1 of last year the tin plate manufacturers asked a reduction of 30 per cent. in rollers' wages, 25 per cent. in heaters' and 20 per cent. to shearmen and doublers. The men refused to accept the reduction and, after a strike lasting several months, the trouble was ended by the Amalgamated Association agreeing to accept a reduction of 15 per cent. in rollers' wages and 12½ per cent. in heaters'. It is believed that the tin plate manufacturers will be asked to restore this reduction, and if they are the request will undoubtedly be refused. A meeting of the Iron and Steel Sheet Manufacturers' Association and the Tinned Plate Manufacturers' Association will be held immediately after the adjournment of the convention of the Amalgamated Association, or as soon as it is known whether any advance in wages in sheet and tin plate mills will be demanded.

SCRAP.

THE *Western Mail* of Cardiff, Wales, has been inquiring into the condition and prospects of the tin plate trade in that country. From its reports, gathered at the close of last month, it appears that in the Pontardulais district there were 21 mills idle, 24 working at a 10 per cent. reduction in the wages, and 8 at a 12½ per cent. reduction. In the Morriston and Swansea district 25 were idle, 10 working at 10 per cent. and 50 at 12½ per cent. reduction. In the Swansea Valley one works—Gilbertson's—was working full time without any reduction. In that district there were 22 mills idle, 7 working at 10 per cent. and 13 at 12½ per cent. reduction. It is suggested by the English trade press that other Welsh tin plate makers might with advantage study the causes which enable Mr. Gilbertson to go on while they are obliged to stop, especially as there is a constant stream of tin plate makers leaving for the United States every week.

RECENT ADVICES from England intimate that the men at one Welsh tin plate works near Swansea have accepted a reduction of 25 per cent. in their wages. It is believed that this circumstance may lead to further strikes and lock outs, as other makers will expect the same concession from their workmen, and this is not likely to be conceded without a struggle.

UP TO THE WEEK ENDING MAY 15 the imports of tin plates at the port of New York had reached 641,293 boxes, as compared with 556,714 boxes in the same period of 1894. The condition of the trade at the beginning of last year was, however, extremely depressed, as

the figures there given are but a little over 60 per cent. of the importations in the same period of 1893 and 1892. As compared with the last ten years the importations of tin plates at this port during the current year are the smallest, with the exception of last year.

F. R. PHILLIPS, Philadelphia, has been awarded the contract to equip and start up the new tin plate plant which the Nivins & Hassard Tin Plate Company are constructing at Thirteenth and Washington avenues, Philadelphia. The initial equipment will embrace three Phillips machines, of the latest pattern, additional stacks being provided for five more sets. Mr. Phillips has recently shipped the first of his machines, through the Totten & Hogg Iron & Steel Company, Pittsburgh, to the Laughlin Nail Company's new plant at Martin's Ferry, Ohio. Several other machines will follow in quick succession.

PHILLIPS TIN PLATE COMPANY, Philadelphia, report that they are rushed with orders, sufficient to run their five sets full through the month of June. The company are making extensive alterations, with the view to facilitate the handling of the raw and finished material. They have recently constructed a new siding, under cover, so that the black plate can be conveniently unloaded direct from the cars, in close proximity to the pickling room, while finished plates can be loaded on the cars, under cover, from the assorting room, thus enabling them to handle their product more quickly and facilitating prompt shipments.

The tin plate plant of the La Belle Iron Works, Richmond, Va., is nearly ready to commence operation. The rolls and furnaces are completed and in place, and the rolling of black sheets will begin within a day or two. It is reported that the plant will commence operations with ample orders on their books to keep them busy for some time to come.

OUT OF A TOTAL of 515 tin plate mills in Great Britain 225 were entirely idle at the end of April, while the larger proportion of those in operation were not running full.

SHIPMENTS of black plates from Great Britain to the United States in the month of April, according to the Board of Trade returns, amounted to 1180 tons, as compared with 39 tons during March. The total shipments of black plates to this country during the current year have amounted to 3947 tons.

IMPORTS of pig tin into Great Britain during the first four months of this year show a decline in quantity of about 2000 tons, and in value of \$1,200,000, as compared with the totals for the first four months of last year.

A LOCAL JOURNAL of Akron, Ohio, states that a company are desirous of locating a tin plate mill in that city.

THE STANDARD TIN PLATE COMPANY of Chicago, Ill., have filed articles of incorporation, with a capital stock of \$200,000, the incorporators being W. G. Burtley, L. C. Welton and Charles E. Davis.

WE ARE ADVISED that the report that the Goff Steel Company, Limited, Pittsburgh, Pa., would erect a tin plate plant at Mendelssohn, Pa., is without foundation. The concern has no thought whatever of going into this branch of business, and never even discussed it. Their specialty is light galvanized hoops and bands for all pur-

poses extra hoops and bands are used. They have a fair share of orders, and from present indications will be able to run their plant full time during the summer.

A PAGE in the new catalogue of the Simmons Hardware Company, St. Louis, Mo., is devoted to a recent department made by the firm. It comprises the brands of American tin andterne plates manufactured especially for this concern. They include Laclede, a high grade charcoal redipped plate of Melyn grade; De Soto, a bright charcoal plate of Grange grade; Ozark, a bright coke plate of J. B. grade; Jupiter, an old process extra heavy coatedterne plate of M. F. grade; Delmar, a charcoalterne of Worcester grade, and Economy, an ordinaryterne of J. G. grade. The Simmons Hardware Company state that all these plates are made of Bessemer steel and are of the highest quality obtainable. They claim that in actual practice their plates have been found superior to imported material of similar grade.

JOHN HAMILTON, Pittsburgh, Pa., manufacturer of Hamilton's Best Redipped American roofing tin, reports an increasing demand for this product, of which shipments are being made to all parts of the country. This is a high grade roofing plate and only the very best materials are used in its manufacture, and in consequence it cannot, it is said, be sold in competition with cheaper grades of roofing tin on the market. Some very flattering testimonials from users of this brand have been received by Mr. Hamilton and he requests the trade to send for samples, which will be sent upon application.

WORK is actively progressing on the new tin plate plant of the Stickney Iron Company, Baltimore, Md., of whom George H. Stickney is president and William Harvey secretary.

MCLIVAIN, CRATER & HIGH, Reading Tin Plate Works, Reading, Pa., advise us that as they have discovered that the name "Victor," which they adopted for one of their brands, is already in use by another concern, they have discontinued the use of it and have substituted the term "A1" in its stead.

THE NIVIN & HASSARD TIN PLATE COMPANY, LIMITED, is the name of a new concern commencing the manufacture of tin andterne plates at 1313 and 1315 Washington avenue, Philadelphia. They have purchased a lot 40 x 113, and have erected a brick building thereon, 26 x 70, in which are installed three Phillips-Newbold tinning stacks. The building is well lighted, and arranged to accommodate about six stacks, provision having been made for perfect ventilation. The entire equipment is an embodiment of the latest and most modern ideas in the way of tin plate machinery. The office building is separate from the main building and contains two rooms. E. F. Nivin, the president, and S. D. Hassard, the secretary and treasurer of the company, have had many years experience in the tin plate trade, the former having been for 33 years and the latter for 16 years connected with the well-known Philadelphia firm of tin plate merchants and manufacturers, Nathan Trotter & Co. L. B. Walters, also connected with the new company, is well and favorably known to the trade. The company will introduce six brands ofterne and two brands of charcoal brights, as follows: Nivin & Hassard New Method, triple coated, a high grade roofing plate; N. & H. Roofing, double coated, a plate

somewhat lower in price; Trilby, heavy coated, a medium roofing plate; Sensation, single dipped, heavy coated, a cheaper grade; Echo, Worcester grade; Dandy, brightterne, and Jewel and Rambler, charcoal brights. The company state that it will be their aim to produce good, honest plates, and that their manufacturing methods will allow of such a production at the lowest prices consistent with the market cost of the materials.

THE general atmosphere of bustle and the jam of freight wagons loading or unloading in the region between Cliff and Water streets, New York City, give one the impression that things are at last beginning to hum in the tin plate and metal trades. This impression is deepened into conviction on inquiry at the offices of the leading dealers and jobbers, where business reigns supreme. The contrast to the condition of things there a few months ago is gratifying and encouraging. Even the "croakers" cease from croaking these days, and the most hardened pessimists are fain to acknowledge that business is "a little better."

Bad times are being experienced by the New York State canal men this year. Since the Erie Canal opened for the season of 1895, only 260 boats have cleared from Buffalo for the East, as compared with 445 for the corresponding period of last year, and every one of these boats is believed to have traveled at a loss. The prospects for the canal men is not encouraging. Grain rates are from 14 to 2 cents, and it is generally understood that no profit can be had in carrying grain at less than 3 cents.

United States Consul General Jernigan, at Shanghai, in a report to the State Department, mentions a considerable falling off in the importations of cotton goods from the United States and Great Britain into the Chinese Empire in recent years, due to the increasing manufacture of cotton cloth by China and Japan and the low price of skilled labor in those countries which enables the mills to turn out their product at less cost than it can be done abroad.

The United States Circuit Court of Appeals, at Boston, on Saturday, handed down a decision in the Bell Telephone case, declaring the Berliner patent on the telephonic transmitter valid. This reverses the ruling of Judge Carpenter of the Circuit Court, given last December, which declared the Berliner patent, held by the Bell Company, to be invalid and ordered it to be given up for cancellation. By the present decision the Bell Company will virtually possess a monopoly of the microphone until 1908.

Statistics of foreign trade, issued in the monthly statement of the Bureau of Statistics for April, again show an excess of imports over exports. The excess in April amounts to \$3,348,363; and the excess for the three months of February, March and April combined is \$9,815,324. Exports for the month show a slight increase over those of April, 1894, while imports have increased nearly \$10,000,000 as compared with that month. For the ten months ended April 30 the balance of exports over imports, including gold and silver, amounted to \$142,856,000. For the same months of the preceding year the excess was \$217,984,000.

Range and Safe Makers' Open End Hand Brake.

The illustrations presented herewith show a new and improved open end hand brake. The cuts, which were made from photographs of the machine

to the sliding portion of the top clamp for the purpose of adjusting the top clamp, bending edge back from the bending edge of the bending bar. This enables the operator to produce round corners on material when required. In addition to the kind of work mentioned, the brake will do all ordinary bending

Discover as accurately as possible the want that exists or the particular object that is to be obtained. 2. Be well acquainted with the scientific principles involved. 3. Know how the want is met or the object obtained in practical life. 4. Find out what proposals have been made by others in the same or in a similar case." A careful attention to these requirements would prevent much disappointment and waste of energy on the part of inventors.

A French chemist is reported to have obtained a new substance, somewhat resembling ordinary porcelain, by the manipulation of asbestos. The fibers of asbestos are exceedingly fine, and give an almost impalpable powder. From this powder a paste is made by the mixture of water, which is thoroughly kneaded and molded into the desired form. By heating the article in a crucible to a temperature of 2400° F., a porcelain is obtained with a translucency comparable to that of ordinary porcelain. An electrical expert who has employed porous cups of this substance says that they have much less resistance to the electrical current than the ordinary cups in use.

The Secretary of the Navy has advertised for bids for the supply of about \$35,000 worth of seamless drawn brass pipe, valves, fittings, pipe covering, sheet brass, &c., for the Mare Island Navy Yard, Philadelphia.

President J. J. Hill of the Great Northern Railroad lately announced that numbers of workmen in the Western cities are seeking information regarding the opportunities of securing farms, and as a result there is a steady emigration of these people into the yet unsettled portions of the Northwest. The officials of the Atchison Railroad say,

of No. 14 gauge and lighter iron or soft steel.

"Business revival is here," says the *Boston Transcript*, "and daily grows more pronounced. But it is a sign deserving particular notice and also the consideration of the student of economics, that instead of wages being the last to experience the benefits of re

in two positions, illustrate it closed in Fig. 1 and opened in Fig. 2, after the formation and for the removal of a four sided figure, which is shown below in the illustrations. The brake was specially designed by J. M. Robinson & Co. of Cincinnati, Ohio, to meet the demand for a brake with which to form and complete a four-sided open end figure around the clamp without extra changing until the completion of the fourth and last bend, when it can then be removed without marring or disfiguring. The top clamp of the brake is supported on standards, one end being pivoted to the standard, which allows it to swing open by releasing the bolt at the opposite end, which is held in place by a wing nut and swings down on its axle. This frees the top clamp and allows it to swing open, when the formed work can be removed. The position of the brake when open is illustrated in Fig. 2. In Fig. 1 the brake is closed ready to clamp the material. The sheet to be bent is inserted between the clamps and then the handle shown at the right hand is pulled forward. This causes the eccentrics, one of which is shown under each end of the bottom clamp, to raise the clamp and secure the sheet for the first bend, which is completed by pulling upward on the two handles secured on the bending bar, on which the name "J. M. Robinson & Co." appears. All the handles are then returned to their first position and the material is free to be moved for the next bend. The operation is then repeated and continued until the four sides are completed, when by releasing the top clamp and swinging it open the work can be removed. The movement of the top clamp is only necessary when boxed ovens or figures of four sides are to be bent. For flanged pans or other flanged work grooves are placed in the top clamp and bending bar deep enough to admit the flanged work. For bending round cornered figures, screws are provided and secured

Fig. 2.—Brake Open for Removal of Material.

covery they have begun to rise coincidently with the beginning of trade revival."

In his "Advice to Inventors," recently published, A. Siemens, the well-known scientist, lays down the following appropriate and timely rules for the guidance of would be inventors: "1.

also, that there is a marked increase in the leasing of farms on the lines of their system. In fact, the movement toward the country in the West seems to be reaching quite remarkable proportions. The men argue that while they may not be able to get rich in cultivating the soil, they can at least count on supporting themselves there in a decent manner.

THE RETAIL STORE.

A Novel Gas Heater.

Among the recent additions to the extensive assortment of gas burning appliances manufactured by F. & L. Kahn & Brothers, Hamilton, Ohio, is a device for heating purposes which is being offered the trade under the name Triple Effect. The essential features embodied in this construction are covered by letters patent granted a few weeks ago. A general view of the device is shown in Fig. 1 of the accompanying illustrations, while Fig. 2 represents a vertical cross section showing the internal arrangement of parts. It will be seen from an inspection of the latter engraving that the body or base of the heater consists of two vertical flues open at the bottom and forming end walls for an open front chamber in which is located the gas burner. Over the burner is a horizontal cross pipe which connects the tops of the two flues, there being a passage at the front and rear of the cross pipe for the movement of the products of combustion. From the top of the stove body and communicating with the combustion

A Novel Gas Heater.—Fig. 1.—General View of Triple Effect Heater.

chamber are a series of flues which furnish the radiating surface. In the center is a vertical flue which communicates at its lower end with the cross pipe already referred to. An ornamental hollow top surmounts the flues, its interior cavity being in communication with the tops of the flues at the right and left of the center. At the top of the center flue is a pipe collar for connection with the chimney. In operation the gas heats the side flues as well as the cross pipe shown in the sectional view. Fresh air enters the lower ends of the flues forming the sides of the combustion chamber and becoming heated in its upward passage flows into the vertical tubes or radiators and from them into the room at a high temperature. The products of combustion and air which has entered the fire place or

combustion chamber pass around the cross pipe and up through the side flues to the hollow top and thence escape to the chimney. The manufacturers call this heater the Triple Effect because it combines in one three systems of heating—namely, by radiation, reflection

Fig. 2.—Vertical Cross Section, Showing Internal Arrangement of Parts.

tion and air circulation. The Triple Effect is made in two sizes and three styles, all having burners giving a powerful and uniform heat with an adjustable air mixer and valve.

The Erie Cast Aluminum Coffee Pot.

The trade will be interested in a new article in aluminum, brought out by the Griswold Mfg. Company, Erie, Pa.

The Erie Cast Aluminum Coffee Pot.

It is the Erie cast aluminum coffee pot, a general view of which is shown in the accompanying illustration. A special feature of the pot is that it is cast all in one piece, including the spout and the strainer in the inside of the spout. The hinges are cast on the pot and cover respectively, and milled out by machinery and drilled so as to make a tight fit. The handle is riveted on by aluminum

rivets, which are cast on the outside of the pot. This feature of construction is particularly alluded to, for by this plan, it is pointed out, there are no defects on the inside due to rivet heads. The inside is polished clean and smooth and the outside polished to a high luster resembling silver. The advantage of a pot without seams will be readily appreciated. These pots are made in three sizes, holding 2, 3 and 4 quarts, and the Griswold Mfg. Company are now ready to ship them in sample orders or in lots.

MEMORANDA.

THE FOLDING BATH TUB COMPANY of Marshall, Mich., are distributing among the trade a 16 page catalogue of their goods. The first six pages are devoted to illustrations and description of their folding bathtub, shown ready for operation and also closed. When not in use some show a beveled French plate mirror and handsome panel wood work, while others are less pretentious and less expensive. Two pages are devoted to their sanitary bath chair, which enables a Turkish or medicated vapor bath to be taken in the residence of the owner. One page is devoted to showing and describing their improved bath heater, which, it is claimed, will warm 20 gallons of water in about 20 minutes. Another of their bathroom fixtures is a hamper for soiled clothing that is in the shape of a piece of furniture and very neat in appearance, the front being hinged at the bottom, thus enabling the top of the hamper to be swung out for inserting or removing articles of apparel. Another page is devoted to their Kitchen Pride cabinet. In the top is a drawer with two large compartments and one for rolling pins, spoons, knives, &c., and eight smaller compartments for salt and spices. Beneath the drawer is a large kneading board, which is removable and which can be placed on the top of the cabinet for mixing bread, pies and cake. Beneath the kneading board is a large flour bin, hinged at the bottom and swinging out at the top, which has capacity for holding about 100 pounds of flour. Loose circulars accompanying the catalogue show a new combination commode, deodorizer and slop jar and a new folding bath that is made entirely of zinc. Another circular shows what they call an "all round compartment," which is firmly supported on uprights and contains ten white maple compartments, 10 x 12 inches in size and 5 inches deep, suitable for displaying garden seeds and small articles of household hardware and tools.

HARRIS & CHAPIN, Oskfield, N. Y., whose retail Hardware business was completely destroyed by fire on the 11th inst., advise us that this misfortune did not in any way affect their manufacturing interests. They accordingly solicit a continuance of the favor of the trade and are prepared to give prompt attention to orders for Red Bank Oil Cans, Eclipse Cabinet Gasoline Tanks, Red Band Gasoline Tanks, Pump and Storage Tanks, Shipping Cans, &c.

Smith's Nested Stove Pipe.

The illustrations herewith show a newly patented nested stove pipe invented by C. A. Smith and manufactured by the American Mfg. Company of Minerva, Ohio, of which Mr Smith is general manager. The pipe is made with a double fold on the left edge, as

with the garbage tray withdrawn. The tray is a long semicircular pan perforated along both sides and having solid ends. After potato peels or the refuse from vegetables that have been prepared for cooking and the refuse from the dining room table have been drained to get rid of the excess of water, the solid matter is placed in the tray, which is in-

eral months, and states that his kitchen waste is converted into charcoal without any offensive odor, and that it is emptied only in the mornings, when the charcoal is used for hastening the fire. The carbonizer is made in different forms so that it can be used anywhere that an ordinary stove pipe can be used. It is so constructed that there is ample space around the tray for the passage of smoke and the products of combustion without affecting the draft, and it is claimed that when used on stoves connected with chimneys having a slow draft no disadvantage has been experienced. It is also claimed that when a coal range is not in use for cooking, a gas jet may be arranged below the garbage tray and the work performed in an equally satisfactory manner. It is said that it has been found popular with servants, who prefer it to using a kettle for the accumulation of the waste.

Fig. 1.—Showing Construction of Pipe.

Fig. 2.—Method of Fastening Pipe Together.

Fig. 3.—Pipe Nested for Shipment.

Smith's Nested Stove Pipe.

shown in Fig. 1. The right hand or raw edge is slipped in between the double fold. The notch in the raw edge comes through the slot in the folded edge. The lip is then turned back and fastens the pipe without the use of a rivet. The small or crimped end is self supporting, as the raw edge can go no further in than the fold, as shown in Fig. 2. It can be set up rapidly by any one with the use of a common awl or screw driver to turn the lip back. Fig. 3 shows pipe nested. It is made in all standard sizes and of all grades of steel and planished iron. It is packed 50 joints in crates for small shipments and wrapped in heavy paper rolls for carload shipments.

Household Garbage Carbonizer.

A device called the Household Garbage Carbonizer is being manufactured by the Sanitary Construction Company, 113 Devonshire street, Boston, and 30 State street, New York. As a means of disposal of kitchen garbage, the apparatus will recommend itself on a

serted in the carbonizer, fitting so as to form a practically air tight joint. The heated gases arising from the stove now come in contact with the carbonizer and the material in it, and after a few hours the effect of evaporation is such as to

Fig. 2.—Used Instead of an Elbow.

leave the matter that has been deposited in it in a condition closely resembling charcoal. The tray is so arranged that it is readily removed, and refuse may be

The Splendid Oil Cook Stove.

The accompanying illustration presents a general view of what is known as the No. 2 Splendid oil stove, now being made by the Novelty Mfg. Company of Jackson, Mich. This stove has a steel frame and an ornamental steel top, rendering it light, yet very strong. The oil reservoir is at the back of the stove, occupying such a position that it cannot become heated, and has a capacity of $\frac{1}{4}$ gallon. The chimney can be instantly removed for cleaning or for trimming wicks. The stove shown is 16 inches in height and has two 8-inch circular burners of simple construction. Other features to which the manufacturers call special attention include polished brass tank, polished brass font, illuminating door and large oven. It is stated that roasting, baking and broiling can be done with entire satisfaction; that the stove is powerful, free from odor and can be economically operated. It is especially adapted for use in hotels and summer boarding houses where increased capacity and quick cooking are required. The company have just issued a little pamphlet illustrating and describing their leading specialties, and in it the more important varieties of the Splendid stove are shown. Attention is also given to the Ruby and Twin Ruby, as

The Household Garbage Carbonizer.—
Fig. 1.—Attached to a Vertical Stove Pipe.

slight examination. It is designed for use in connection with the cooking stove and is made in several forms to meet the various requirements. It consists of an enlargement of the smoke pipe to hold the garbage tray, with sufficient space around the tray for the products of combustion arising from the stove to pass by freely. Fig. 1 shows the carbonizer attached to a vertical smoke pipe and

placed in it as frequently as it is made in the kitchen. The material which remains in the tray is available for kindling a new fire in place of wood and shavings. Fig. 2 shows the device used in place of an elbow, one of the many variations in shape in which it may be applied. Dr. S. H. Durgin, Chairman of the Boston Board of Health, has tested the device in his kitchen for sev-

The Splendid Oil Cook Stove.

well as to the portable oven which is used in connection with the company's goods.

BOYES & POLLOCK, Sistersville, W. Va., have dissolved partnership, and their stove and hardware business will in future be carried on by J. W. Boyers at the same place.

STOVE TRADE NOTES.

The Chicago Stove Trade.

The Chicago stove houses are now starting out their travelers for the regular summer campaign. Within the next two weeks the country tributary to the Garden City will be pretty well covered by these tireless messengers, all anxious to fill their order books. A few instances have been found in which an early start has been made by the representatives of some houses. From these come varied reports, but varying more in degree than in character. All are encouraging, showing a much better feeling among retail buyers than had been hoped. Several houses go so far as to report decided improvement as compared with the trade of last year. The demand on the Pacific Slope has shown up remarkably well. Montana and other portions of the Rocky Mountain district are doing handsomely. Carload orders are mentioned as though such things these days were not rarities. The Dakotas and Kansas and Nebraska are backward, as might be expected from States which last year were so severely scourged by drought, but Minnesota, Iowa, Missouri, portions of Wisconsin, Michigan, Indiana and Illinois are looking up encouragingly. Every indication now points to a good volume of business as the fall season draws nearer.

"But," sighs a forlorn stove manufacturer, "I am afraid we'll never again see such a year as 1892." Well, perhaps not this year, but possibly some other year not very far distant. In 1889 and 1890 there was little to be seen on which to base the hope of a great improvement in trade. The question was frequently asked, "What is the matter with the stove trade?" and answered as now by references to poverty-stricken farmers, or the competition of hot air furnaces, steam and hot water boilers, gasoline and gas stoves, oil stoves, &c. But somehow the trade picked up and a little improvement was visible in 1890, followed by decided growth in 1891 and a heavy movement in 1892. History will repeat itself. An improvement this year may naturally be expected to develop into greater proportions next year and so on up to a climax which should at least rival 1892.

Meanwhile, however, stove manufacturers are not resting on their past achievements and performances, but are making new ventures. They are almost without exception adding other lines to the manufacture of standard stoves. Gas stoves, furnaces, oil stoves, steel ranges, steam or hot water boilers are being taken up as side lines for the purpose of holding fast to or capturing more of the business which stove manufacturers look upon as legitimately belonging to them. They do not take kindly to this change in the character of their trade. A prominent manufacturer a short time since looked around his sample room, which was once filled with

S. TOWNSEND PECKHAM.

an orderly array of polished cook stoves, ranges and heaters, and as his eye rested on a conglomerate mass of oil stoves, furnaces, cook stoves, gasoline stoves, steam boilers and ranges, he said: "Well, this is too much like a notion shop to suit me." Yet he is an aggressive business man, and notwithstanding his inclinations will exploit any line in which he sees an opportunity to secure trade. This inclination with him and others is now running more particularly to cooking appliances. The success of the establishment making a specialty of wrought iron or steel ranges, together with the inroads of furnaces and boilers on the heating business, have almost effected a revolution in the stove trade. Increasing attention seems destined to be given hereafter to cooking apparatus, while heaters will be largely left to those who have most assiduously cultivated that trade.

S. Townsend Peckham.

In our last issue brief announcement was made of the death of S. Townsend Peckham, for many years the honored treasurer of the National Association of Stove Manufacturers, and at this time we present an excellent likeness of him together with some particulars of his life and business connections. He was born at Utica, N. Y., on January 11, 1839, being the son of John S. Peckham, who settled in Utica in the year 1817 and who in 1827 is said to have produced the first stove made in that city. At the age of 17 years S. Townsend Peckham left the Utica Academy and entered the employ of his father, who in 1835 had formed, in connection with his brother Merritt, the well-known firm of J. S. & M. Peckham. By reason of his ability, application and energy the young man soon acquired a thorough knowledge of stove manufacture in all its details, as well as a thorough familiarity with the mica business, in which J. S. & M. Peckham were largely interested. In the year 1879 John S. Peckham died, at which time his son acquired an undivided half interest in the business. The firm name, however, remained unchanged through all the years which followed and it was only a year or two ago that a corporate name took its place. About five years ago S. Townsend Peckham retired from business and went to Minneapolis, Minn., where he remained for nearly a year. Subsequently he removed to New York City, where for the past three years he was manager of the Palermo Mica Company.

Mr. Peckham was a charter member of the National Association of Stove Manufacturers and was to be found in attendance at nearly every convention. He was of genial disposition and very popular with all having business relations with him. He succeeded Uriah Hill, Jr., as treasurer of the National Association of Stove Manufacturers, being elected at the fifteenth annual convention, held at the Galt House, Louisville, the first week in February, 1886. He continued as treasurer until 1892, when he was succeeded by W. S. Stevenson, the present incumbent. By reason of Mr. Peckham's prominence in the mica trade he was familiarly referred to by his friends and associates as the "Mica King," and members of the stove association composed a song about him beginning with the words:

"It is, it is, a glorious thing
To be a mica king."

Mr. Peckham was possessed of excellent business ability and was highly regarded wherever known, commanding

the esteem and respect of a wide circle of business and social friends.

For more than a year past Mr. Peckham had not been well and three months previous to his death gave up business and took a trip South for his health. The change, however, did not bring the improvement sought and his death occurred suddenly of heart failure at midnight on May 11. The funeral services were held at 5 o'clock on the afternoon of Tuesday, May 14, at his late residence, 136 West Seventy-sixth street, New York City, the Rev. Dr. Brown, pastor of Westminster Church, Utica, officiating at the services. Tuesday night the body was taken to Utica, N. Y., where burial services were held at the Forest Hill Cemetery. Mr. Peckham leaves a widow, four sons and two daughters.

THE METRIC METAL COMPANY of Erie, Pa., favor us with a copy of a neat little pamphlet of pocket size which

Furnace Heating With a Fan.

A new departure in furnace heating is shown in the accompanying illustrations, the result of a series of experiments by Geo. W. Kramer of the firm of Kramer & Simonson, architects, Metropolitan Building, 1 Madison avenue, New York City. A few years ago while Mr. Kramer was a resident of Akron, Ohio, he was architect for a church building in that city; and as the congregation were desirous of having good ventilation and a heating plant which required the minimum amount of care and repairs, he drew up specifications and had a hot air furnace and fan system installed. The success of this system has led to its adoption in several churches for which his firm have been the architects. Churches in which this character of heating plant may be found complete or in course of construction are at Waterbury, Conn., Bristol, Conn., Williamsbridge, N. Y., and Forty-

heating surface. These furnaces are arranged in a brick shaft which is 36 x 48 inches in size and which is built up like a chimney so that the top is 15 feet above the surface of the surrounding ground. From the bottom of this cold air shaft the cold air duct is taken, as shown in Fig. 2, it being 32 x 48 inches in size. The duct continues this size to the fan chamber, which is 50 x 54 inches and 54 inches high. In one side of this chamber is an opening for a 38 inch pipe, and a 48-inch Hyatt & Smith disk fan is located on the furnace side of this chamber. The duct then branches into three supplies, one running to each of the furnaces, with dampers so placed that any one of them may be closed off when desired, the top of the furnace chamber being so constructed that all the pipes receive a supply of air when but one furnace is in use. The smoke from the radiator of the three furnaces is carried by means of

Furnace Heating with a Fan.—Fig. 1.—Plan of Basement and Heating Apparatus.

they have issued relating to their Classic gas stoves. These are made in several varieties and possess features for which strong claims are made. The body of the stove is of No. 20 steel clamped tightly to the frame, while the outside oven top and inside oven bottom are of cast iron, all outside walls being lined with heavy asbestos boards. The double and single boiling burners are provided with patented shedding roof caps, which prevent the flames from leaving the burners and the holes from becoming clogged by the boiling over of kettles during cooking operations. The makers state that their 17 and 19 inch oven doors are balanced by weights under the baking oven. The broiling burner is located between the boiling burners and the oven top, thus making broiling and toasting an easy matter. Full instructions for operating the Classic stoves are given in the pamphlet, as well as dimensions of broilers, ovens, &c. The company also manufacture gas meters, open gas grates and fire places.

eighth street and Eighth avenue, New York City. The plant which we describe and show has been installed at Derby, Conn., by S. G. Richards, 1454 Broadway, Brooklyn, N. Y., and was designed from the specifications by his heating engineer, W. E. Roys, who superintended the installation of the plant.

Fig. 1 shows the plan of the basement and heating apparatus. Fig. 2 is an elevation showing part of the plant. Fig. 3 shows the first floor and audience room. Fig. 4 shows the gallery. There are three furnaces used, each having a fire pot 16 inches deep made in two sections, and having a diameter of 30 inches at the top and 26 inches at the grate. Above the fire pot is a section in which the feed door is placed and which flares to receive a specially constructed radiator that is 36 inches in diameter. The radiator is composed of eight sections made of cast iron and is 36 inches in height. From each one of the sections there is a rib which extends out 6 inches to give additional

8-inch pipes into a 16-inch pipe, which is carried to a chimney 24 inches in diameter. The fan is driven by a 13 horse power Crocker Wheeler electric motor, which is located in a brick extension outside of the church proper so as to meet the views of the insurance companies. The power is transmitted from the motor to the fan by means of a shaft which is supported on brick piers, pulleys being arranged to connect with both motor and fan by means of belting. The brick piers are used to avoid the vibration and noise of the fan, motor and shafting being transmitted to the church, as has been found to be the case when the shafting has been attached to timbers which were fastened to the floor joists of the audience room. When the motor is run at full power the fan is capable of about 1000 revolutions per minute and secures a velocity of air of about 700 feet per minute. It has been found on experimenting with fans in connection with furnaces that it is necessary to protect the fire pot from the chilling effect of cold air which is forced against

it in order to secure proper combustion in the fire chamber; and for this purpose a brick wall was built around the fire pot extending up nearly to the top. In this case, however, it was found that the fire pot became excessively hot, and it was necessary to lower the wall to such an extent as to practically re-

when it rises to the horizontal distributing pipes. This pipe is shown taken from the left side of the furnace in Fig. 2; and a 12 x 18 inch register is taken from this pipe at the point where the turn is made at the top, for heating the dining and lecture room. Another opening to supply a 16 x 24 inch radi-

often complained of where large windows are found. The other heating pipes are run as shown in Fig. 1. Back of the pulpit and superintendent's platform are two ventilating shafts heated by independent apparatus. Air is turned into these shafts through openings which do not show, being

Fig. 2 - Elevation Showing Part of System.

move it. The fan being located back of the furnaces it forces the air through them, maintaining a pressure on them, so that should any crack or other opening occur in the furnaces it would be impossible for gas to escape, as the air pressure would force a current of air into the furnaces through the openings. In the basement, on the same level with the furnaces, one-half the building is

tor is taken from the vertical line at the other side of the lecture room. That section of this warm air duct which passes under the floor is made of mason work to insure its durability and is 20 x 30 inches in size. The horizontal distributing pipe is located under the floor of the Sunday school room; and connections are taken from it to heat the classrooms on the first and second

placed at the top of risers in the steps leading to the pulpit and platform. Other ventilating flues are taken from each of the classrooms shown. When in full operation the heating plant will change the air in the entire building, which contains 225,000 cubic feet of space, four times in an hour. In order to secure economical heating in extremely cold weather, previous to the assem-

Fig. 3.—Showing First Floor.

finished as a dining and lecture room and a ladies' parlor, and in order to avoid disfiguring this room with pipes running across the ceiling the pipe heating about one-fourth the upper part of the building is made to take a drop of about 15 feet after it has run 30 feet from the furnaces, and pass under the floor of the dining and lecture room to the opposite side, or 42 feet further,

floors, the pipe continuing around and diminishing in size, as shown, until the back or north of the church is reached. Here under a stairway, and close to an immense glass window, two registers are placed, one being taken from the side of the pipe and the other from the end. The effect of this large discharge of air near the window is to prevent the usual cold currents, which are so

blage of the audience, an exhaust system has been arranged in connection with the apparatus. One large register is placed in the dining and lecture room and two in the floor of the Sunday school room and one large register in the floor of the main audience room. These are connected with a 38-inch pipe to the fan chamber, and by a system of dampers the cold air can be shut

off from out of doors and the air in the church revolved through the furnace. The apparatus was first put in operation during the coldest weather of last winter, and demonstrated its ability to keep the building at a comfortable temperature with the fans running at little more than half of their full speed and with but two of the furnaces in operation. It has been found on investigation by the Church Committee that the temperature is nearly equal from floor to ceiling and that the gallery is not overheated. It was also found that the building can be warmed in about two hours. It is, therefore, not necessary to start a fire over night for Sunday service. It is furthermore pointed out that there is no danger of the apparatus freezing when not in use. It is stated that a noticeable absence of drafts has been found, and that the temperature of the incoming air is never unpleasantly hot and dry. Special notice has been taken

power to drive it by electricity, water motor or gas engine, should be especially designed for the purpose.

Isaac Sheppard & Co.,

Philadelphia, Pa., have just issued a catalogue covering a line of their goods especially suited to the building trades. The book contains 28 pages, 11½ x 8½ inches in size, and opens with Paragon hot air furnaces, of which numerous varieties are shown. A page is devoted to a description of the furnaces and the points of advantage they are claimed to possess over other makes, following which are Paragon combination furnaces for heating by hot water and hot air. A broken view represents the hot air parts treated transparently so as to show the hot water circulator. This style is described as made in three sizes, with either steel or cast radiators. The Paragon brick set furnace has a front which is higher and wider than the

take cold air from beneath, or upon feet and front support, to take air from a cellar. It is made in six sizes. The line of furnaces concludes with the Excelsior, which is shown with tubular and plain drums, and is described as a cheap and efficient furnace. Royal Fidelity ranges, for hard or soft coal, coke or wood, are next shown. These are designed especially to meet the requirements of large as well as small families. The ranges are shown in various styles, with horizontal boiler, high boiler front and cast mantel, low boiler front, hot air attachment, portable for vertical boiler and for brick setting. Fidelity ranges follow and are described as smaller than the Royal Fidelity, but made in similar styles. The Excelsior brick set range is made in several sizes, with single and double ovens and with and without hot air attachment. All the boilers used in the ranges are said to be made from extra heavy steel plate, black or galvanized, and they are all tested to a

Fig. 4.—Showing the Gallery.

of the purity of the atmosphere and its effect on the congregation, the claim being made that there is less coughing and fanning than is ordinarily noticed in a large congregation and also that it is not necessary to heat the church to a temperature of 70°. Another advantage which is claimed for the apparatus is that it can be used to create a circulation of air during the summer season. It is stated that as the fire is run but a few hours considerable fuel is saved, and that the expense of running the electric motor for the short time necessary is but slightly in excess of the fuel saved. In all of the plants of this kind that have been erected progress has been made in perfecting this system of heating, which it has been demonstrated has clearly passed the experimental stage. With each plant something new has been learned and it is the opinion of Mr. Kramer that a furnace for use in connection with a fan, whether the

front itself, so that the latter may be easily removed through the front opening without disturbing the brick work. The furnace is fitted with removable draw center or triplex grates, operated by a lever shaker, while the interior construction is the same as in the portable furnaces. Another view shows the furnace with steel radiator and with an adjustable cast iron elbow. This style is made in three sizes and is furnished with the combination hot water attachment when desired. Still another view shows the furnace with cast radiator for soft coal, after which are described the Fidelity steel plate furnaces of the three-drum type, with central draft and revolving scraper and embodying some of the features of the Paragon furnaces.

The Fidelity is made in three sizes and is offered as an efficient furnace, lower in price than the Paragon. The Saxon steel plate furnace has a double drum and revolving scraper, and is adapted to be set either over a pit, to

pressure of 150 pounds to the square inch. In a paragraph on page 20 of the catalogue it is stated that as the pressure upon locomotive boilers rarely exceeds 120 pounds to the square inch, some idea of the strength of these range boilers may be gained. The book concludes with illustrations and descriptions of Fidelity fire place heaters with round and square frames and with and without magazines. The book is bound in stiff paper covers with cloth back, the front page bearing the title, and the back page a large cut of the firm's new Royal Excelsior range, a portable range made in 18 sizes and varieties.

THE CENTRAL STOVE REPAIR COMPANY, 357 West Thirty-eighth street, New York, issue a catalogue to the stove trade giving the names of stoves and makers for which they can supply grates, bricks and other fixtures. They also make a specialty of black lead, stove bolts and a line of supplies.

ODD PLATES.

THE RECEIVER of the Sloux City Stove Works, Leeds, Iowa, has applied for authority to sell the plant, and it is expected he will turn it over to a new company as soon as authorized so to do by the court.

THE ANNUAL MEETING of the stockholders of the Keeley Stove Company was held at Columbia, Pa., on the afternoon of Monday, May 13, when the following directors were elected to serve during the ensuing year: S. S. Detwiler, Hiram Wilson, H. F. Bruner, William Patton, J. H. Herr, F. A. Bennett, William B. Given, William Morris and Frank Bucher.

A RECENT ISSUE of the *Canadian Trade Review* is the authority for the statement that the Gurney Stove & Range Company, Limited, have applied for incorporation in Manitoba to deal in stoves, ranges, hardware, metals, &c., the capital stock being placed at \$50,000. It is also stated that the company will assume the business in Manitoba of the Gurney Company of Hamilton. The names of those applying for incorporation are given as Charles Gurney, John Henry Tilden, Oswald Gurney Carscadden, Henry Gurney Carscadden of Hamilton and James Burridge and Isaac Walter Martin of Winnipeg.

SCHILL BROTHERS of Crestline, Ohio, favor us with an advance copy of a new range catalogue which they are distributing to the trade. It is a neatly printed publication, bound in paper covers, with side title consisting of the words "Schill's Steel Ranges" printed in blue upon a light shade of buff. In the introduction to the trade the makers refer to some of the many features embodied in the Schill steel ranges, special attention being directed to the patent double balanced door or full drop oven door with which the ranges are fitted. All the oven doors have arms to support them when open, the arrangement being such that in opening the door the lower half drops down and forms a substantial shelf, while the other half turns up, forming a shield to prevent the hot air from striking the face of the person operating it. The opening of the door is accomplished without the means of weight or springs, and the upper part is entirely independent of the lower, yet either one will operate the other by a mere touch of the handle. The Schill range is provided with either duplex or flat dumping grate, one size of which fits any size of range the firm make. The damper is operated from the front. The entire body and the oven are made from cold rolled steel, the oven bottom being heavily ribbed to prevent warping, while the body is lined with asbestos and steel. The makers state that they are prepared to offer over 200 distinct styles and sizes of the Schill range, a few of which are illustrated in the catalogue under review.

THE MAY NUMBER of the monthly publication issued by Fletcher, Russell & Co. of Warrington, England, consists of 146 pages, illustrating a great variety of gas burning appliances. Special attention is directed to the company's triple cased indestructible ranges with patent removable porcelain enameled linings, which are said to be rapidly superseding all others. The assortment of gas cooking and heating stoves is a varied and interesting one, covering all requirements from the smallest to the largest. Attention is given to water heaters, burners, and iron heaters, greenhouse boilers, blow

pipes, forges, furnaces, fire pots and other laboratory appliances.

RATHBONE, SARD & Co. of Albany, N. Y., have issued some very pretty cards calling attention to the Acorn stoves and ranges. One side of the card has a lithographed picture printed in pleasing colors, while the other side states, among other things, that Acorn ranges and stoves have stood the test of over 60 years, that only the best new iron and the highest grade of skilled labor are used in their construction and that they are suited for all kinds of fuel.

THE FOLLOWING QUOTATION from a letter recently received from a correspondent in Buffalo will be of interest in its bearing on the subject of gasoline insurance, a subject which was recently discussed in our columns: "The rules adopted by the Buffalo Board of Fire Underwriters provide that no extra charge shall be made for the use of vapor stoves, the only restriction being that the insured must obtain a permit and attach it to his policy, allowing the use of vapor stove. The stove must have a safety tank and the supply of gasoline must be kept outside of the building."

W. H. PFAEHLER of the Abram Cox Stove Company, Philadelphia, sailed for Europe on the "Friesland" on Wednesday last.

J. WOODRUFF & SON, Salem, Ohio, have just issued from the press an exceedingly neat and tasteful supplement consisting of eight pages carefully arranged and bound in paper covers of a deep red. The side title consists of the name and address of the manufacturers, with a line at the top stating that the business was established in 1846 and the concern incorporated in 1879. The printing is in delicate shades of two colors, and is as neat as anything we have lately received. The pages call attention to the makers' line of Excelsior cook stoves, designed for burning coal and wood. These goods are made in a number of styles and sizes, and possess, among other features, square ventilating oven, top and centers, plain draw out hearth, oval fire box for coal, cemented oven top, large ash pan and nickel trimmings. The Excelsior four-hole cook for wood only is made in three sizes and has square ventilated oven, draw out hearth, extra large fire box, deep ash pan, &c.

THE BARSTOW STOVE COMPANY of Providence, R. I., are noted for the quaintness of the announcements which they issue. The latest scheme is designed by the Livermore & Knight Company of Providence and consists of a folder of heavy paper containing within its covers a map showing a multiplicity of islands, reefs, shoals, &c., but with a series of arrows indicating the safe channel. The course is from Pleasure Island to Prosperity Island, which is reached, according to the map, by the Bay State Line. The sailing directions for reaching Prosperity Island are given below and are worth memorizing: "Steer straight into Caution Channel, avoiding Cheap Dodge Creek and Pleasure Island (strong current toward the island). Keep Long Credit Rocks well on the starboard. Pass Sit Down Bay at full speed, avoiding Endorsement Reefs (no lights here) and Speculation Shoals (considerable fog here), keeping Mining Stock Sands well on the port (a great many derelicts about here), keeping well away from Short Cut Creek (passage very uncertain). Southeast by Sleeper's Island and Sporting Creek (sharks large and hungry).

Keep High Interest Ledge on the port (no soundings here), then into Cash Discount Channel. Pass well to the east of Fast Horse Rocks (Dark Horse Rock covered at low tide). Avoid Syren Bay, anchorage expensive here. Land all cranks at Kicker's Point. Steer midway between Firewater Shoals and Poker Bluff into Industry Channel and you will, in time, bring up at Prosperity Island, the objective point of all who sell the Bay State stoves, furnaces and ranges and the Dangler gasoline stoves."

A. C. BARLER MFG. COMPANY, 104 and 106 Lake street, Chicago, are now making preparations for the coming season, and expect to inaugurate a vigorous campaign in the line of oil heaters. They will offer some new features which they are not quite ready to disclose. In their new location they enjoy very great advantages, having much more room than before, besides securing much better light, which is in itself a guarantee of more efficient workmen.

THE STANDARD LIGHTING COMPANY of Cleveland have established a retail branch at 54 State street, Chicago. They occupy a store room 25 x 90 feet and a large basement. The arrangement of this store is such as to enable prospective buyers to witness any style of gas stove in operation. A large line of varied sizes and styles extends along one side of the deep store room, all being connected with the gas service. One range is connected with the water service so as to demonstrate the rapidity with which water can be heated with the water heater specially designed for their ranges by this company. They carry a full line of gas and gasoline stoves, oil heaters, lamps, torches, &c., covering all the goods made by the company. Prominently shown in the room is the patent reflex knock down oven for gas, oil or oil stoves, or for small gas stoves, on which the company have had and are still enjoying a very large trade. The store room has its own elevator connected with the basement for the convenient handling of goods. The manager in charge is C. W. Austin, well known to the gas and gasoline stove trade. He is assisted by L. W. Lewis, who for the past five years has been with the Standard Lighting Company, and by C. H. Behlen, a gas stove expert. The location of the store is excellent, and the arrangements have been made on a scale which will no doubt prove highly attractive to the citizens of Chicago.

THE FULLER WARREN COMPANY of Milwaukee and Chicago have recently brought out a number of new goods, of which samples are now shown on the floor of their Chicago salesroom. Prominent among these is a new gas range named the Stewart. This is a decided departure for the company. The range is beautifully designed, and is built in cabinet style, with or without water heaters. It is made with four-hole and six-hole tops. The oven is removable. Self closing doors are provided for the oven and broiler. The decoration is highly ornamental, consisting of molded and nicked borders around doors, together with richly ornamented name plates. Care has been taken in the construction of these ranges to embody all the improvements essential to the production of a first-class modern gas range. Fine specimens are exhibited of the first steel ranges which have so far been made at the Milwaukee works. These ranges are made in two sizes, with four

and six holes. They have drop oven doors, duplex grates with cast linings and round end fire boxes. They are made with high shelves and with or without high closets. They are handsome in appearance, being finished with nickel bands around the top shelves, nickeled and handsomely modeled corner pillars, nickeled door frames, heavy towel bars on each end, &c. These ranges have been named the Steel Stewart. They are stated to be economical hard coal ranges, although adapted to use either hard or soft coal, and have already proved to be good sellers. A new line of six-hole medium priced ranges has been brought out under the name of the Premium Stewart. They have a square oven, and oval fire box, sheet flue, draw center grate, draw hearth plate and mica panels in the front door. They are finished in all styles on base, having no low warming closet, and are adapted to any kind of fuel. The ornamentation is in rococo style, of bold and striking design, producing the effect of massiveness. Another line, ornamented in a similar manner, is the new National Stewart four-hole range, adapted to all kinds of fuel and furnished with several feeds. These ranges are specially made with hard coal or pouch feed, or with a closed front for wood only. Cooking stoves have been brought out in precisely the same style, and they will shortly be followed by a six hole range in the same class.

HART & CROUSE, Utica, N. Y., and 211 Water street, New York, are distributing a 48-page catalogue of their Royal hot air furnaces. In their introductory remarks they say: "The method of heating buildings by hot air furnaces is a very popular one and one that has been more largely used during the past half century than all other heating systems combined." This is followed by a description of the rules which must be observed to secure successful operation and satisfactory results. The first few pages are devoted to the Royal hot air furnace, shown both portable and brick set and with steel and cast iron radiators. This is followed by the Prince Royal, which is made with large feed door and adapted for burning both coal and wood. The next pages are devoted to the Royal Victor and Imperial hot air furnaces. Two pages are used for showing the Pleasant Home ventilating furnace. The Sterling coal furnace and Royal wood furnace are shown both portable and brick set. The Prince Royal combination hot air and hot water furnace is shown, with a table giving the amount of radiation which each size will carry. The Royal smoke consumer is a furnace constructed for burning soft coal and is provided with ducts which carry air from the outside of the furnace to the fire chamber. Half tone engravings are used to show sections of the Prince Royal and Royal, illustrating the construction of the radiating section and of the grate and ash pit. The last pages of the book give instructions for setting and managing both the brick set and portable furnaces and tables giving the dimensions, price and capacity of the furnaces.

THE CLEVELAND FOUNDRY COMPANY have moved their New York office to 103 Beekman street, where they also have a frontage on Pearl street. They are arranging to make a fine display of the Puritan gas and oil cooking stoves.

THE NEW YORK STOVE REPAIR ASSOCIATION, 230 Waterstreet, New York,

are getting things very conveniently arranged in their new quarters. They occupy the basement and four floors of the building, and have constructed nearly 10,000 bins for storage of the various kinds of stove repairs which they carry in stock.

THE BARTSTOV STOVE COMPANY, Beekman and Water streets, New York, are making a specialty of the Dangler line of vapor stoves. They have a fine line of samples of the New Process, and are making a strong push on the new Gem generating stove. This stove can be lit in a very short time, without any high flame or noise, and in operation burns with a flame very similar to that shown on the New Process stoves. The leader of their line of gas hot plates is the Irving, which has a specially constructed burner for which high efficiency is claimed and which is provided with a regulator for governing the air mixing chamber.

THE PERRY STOVE COMPANY, 242 Water street, New York, have a gas hot plate in their Champion, which is becoming quite popular in the trade. The supporting feet are much higher than those used heretofore, and the burner is made in sections so that it can be readily removed from the stove for cleaning should it be necessary.

CHARLES O. LYON, president of the Thatcher Furnace Company, 240 Water street, New York, is rusticking in the Adirondacks.

THE RICHARDSON & BOYNTON CO., 234 Water street, New York, report that they are highly gratified with the performances of their Perfect hot blast furnaces during the past winter. The efficiency of the hot blast has been proven, whether used with hard coal or soft coal or the fine fuels that are generally used under power boilers. A large number of these furnaces have been sold in widely different sections, and the outlook for an increased trade this year is said to be good.

THE CENTRAL STOVE REPAIR COMPANY of New York City have been incorporated, with capital stock of \$35,000. The directors named are Albert W. Herche, James A. Bullaes of New York City and B. C. Davis of Brooklyn.

FLASHINGS.

THE CHATTANOOGA STEEL ROOFING COMPANY, Chattanooga, Tenn., favor us with one of their illustrated catalogues for 1895. It is a pamphlet of large dimensions, measuring 12½ x 9 inches, bound in colored paper and containing 60 pages of illustrations and descriptions. The publication is divided into two parts, the Galvanized Iron Work Department and the Roofing Department. The first goods shown are fronts, 21 different styles being illustrated, so that the architect or builder has a very large variety to choose from. Cornices cover four pages, then come window caps, with two pages, while finials are presented in many different styles and designs. Conductor heads are shown on page 26, while cresting, cresting blocks and finials occupy four pages. Skylights, eave troughs, piping and miscellaneous goods follow, the last two pages of the department being given to cast iron work. The Roofing Department covers 21 pages. It relates to Crowl's patent steel roofing, double seamed steel roofing, Eureka roll and capped patent crimped and three-crimped steel roof-

ing. Steel weather boards, pressed bricks, ceiling and siding, corrugated iron, corrugated doors and shutters, &c., besides a full assortment of roofing sundries, complete the pamphlet. The book will be valued by all who are interested in sheet metal work of this sort, and those of our readers who have use for the materials referred to will do well to secure a copy of it.

M. CULLEN, Hartford, Conn., has the contract for the handsome copper cornice and window caps on the Freeman Building on Asylum street, and also for all the metal work on the Old People's Home Building in West Hartford. Mr. Cullen also has the contract for the sheet metal work for some extensions to the plant of the Pope Mfg. Company. One will be a forging shop, 20 x 46 feet; another building is 50 x 154 feet. An extension 100 feet long is being made to their repair plant.

THE VINCENT ROOFING COMPANY, 445 West Forty fifth street, New York, are engaged on the sheet metal work for the ventilating system in the public school at Eighty-second street and West End avenue, for which they also have the roofing contract. They have the contract for the cornice, roof and balustrades for the new Montauk Theater, which will be erected in Brooklyn. They also did the sheet metal work for the ventilating system in the Hotel Majestic, New York. They have recently completed a copper roof on the residence of J. A. Bailey, 155th street and St. Nicholas avenue, using sheets 14 x 20 inches in size and laying a sheet at a time, as tin roofing is frequently done.

G. BICKELHOUT, who makes a specialty of metallic skylights, at 243-245 West Forty-seventh street, New York, has excellent shop facilities for producing these goods, and has a number of patent devices for adding to the efficiency of his skylights.

THE GARRY IRON & STEEL ROOFING COMPANY, Cleveland, Ohio, shipped last week a large iron building and covering into Texas.

THE CHATTANOOGA STEEL ROOFING COMPANY, Chattanooga, Tenn., are making an addition to their buildings.

THE NEWPORT ROLLING MILL, Newport, Ky., report a very substantial advance in the demand for their corrugated roofing, galvanized iron and stove pipe. Their mills are kept at work day and night, with orders on hand said to be sufficient to carry them through the entire summer.

THE ILLINOIS ROOFING & SUPPLY COMPANY, 203 Lake street, Chicago, have issued a number of circulars referring to their specialties. Much attention is given to Gilbertson's Old Method roofing tin. A specially attractive circular is gotten up in folder style, with each page handsomely illustrated, with one page ruled for an address and another page arranged to form a card for requesting prices from the company. Roofing specialties are shown on the other pages.

The contract for the continuation and termination of the extension work at the Port of Vera Cruz has been renewed with the firm which began the work some time ago. It is said that, in four or five years at the most, the largest ships will be able to load and unload at the piers of Vera Cruz harbor, instead of having to remain in the offing, as has been the case hitherto.

TRADE REPORT.

Metal Market.

Pig Tin.—Prices in the wholesale market have fallen about 0.20¢. The decline is attributed in part to realizations by holders of stock purchased when prices were about 1¢ below where they are at the present time and to vigorous manipulation by the bear interest in London and on this side of the Atlantic. To all accounts purchases by consumers and interior dealers have fallen off and their requirements seem to be satisfied in no small degree by deliveries that are being made on old contracts. The consumption is heavy, nevertheless, and the amount of Tin taken thus far this month has considerably exceeded the importations, leaving the statistical position stronger. In small lots from store Straits Pig is quoted at 15½¢ @ 16¢ per lb.

Copper.—The market is very firm at the line of prices established last week and a fairly large business has been done in Lake Superior Ingot and Electrolytic sorts for future delivery. The buying was largely on home trade account, but not wholly by consumers or exporters. In other words, there has been a certain amount of investment, and that, too, in the face of the refusal of a very prominent mining company to agree to the proposition to restrict exports. This action confirms late reports of actual business and prospects being such that the market is virtually taking care of itself despite quite heavy output. Casting stock has not fared quite as well as the higher grades of Copper. The price for small lots of Lake Ingot from stock remains at the level of last week's quotations, namely, 11½¢ per lb.

The monthly production of Copper in the United States has been as follows, according to John Stanton, the first column giving the aggregate returns from the reporting mines, which include the principal Lake, Montana and Arizona producers; the second, being the metal from pyrites and from a number of smaller outside sources, being estimated:

American Product.			
	Reporting mines. Gross tons.	Outside sources. Gross tons.	Total. Gross tons.
Second half			
1892.....	59,239	6,287	65,526
First half			
1893.....	62,470	6,478	68,938
Second half			
1893.....	67,290	8,252	75,542
Totals, 1893.....	129,760	12,730	142,490
First half			
1894.....	73,951	8,040	81,991
Second half			
1894.....	68,592	9,049	77,632

February.....	8,730	3,450
March.....	7,424	3,011
April.....	7,219	6,677

Sheet Copper.—The demand for Sheet Copper and Manufactured Copper of all descriptions continues to expand. Orders are coming in very freely and a feeling of decided confidence is manifested among dealers and consumers, who appear anxious to replenish their depleted stocks. Manufacturers, on the other hand, are only quoting on orders for immediate delivery or very early shipment. The leading mills have withdrawn quotations and prices are stiffening, with every prospect of a general advance in the near future.

Pig Lead.—Purchases here have not been as heavy the past week as they were during the preceding, but considerable business has passed and prices have held up decidedly firm. A certain amount of speculative interest has prevailed, more particularly in the West, but aside from that the business done has served to at least add tone to the market. Small business has been good, with prices for moderate jobbing lots at 3½¢ @ 3½¢ per lb.

Lead Pipe and Sheet.—An extremely good demand has developed from the plumbing trade. Manufacturers are busy on orders and the outlook is regarded as favorable for better prices and an expanding market. While list prices are adhered to in this section a stiffening tendency is apparent, which will probably lead to an early revision of the current rates in order to place them in correspondence with the rise in raw material.

Spelter.—The metal continues to maintain the strong tone noted in our last report. Stocks in makers' hands are light and the offerings are consequently limited. Eastern buyers have purchased somewhat freely, and it is an open secret that some lots were taken by local firms closely identified with export trade. The market is not at all excited, but is showing what looks like enduring firmness. The current rate for small lots of good Western Spelter from store is 4¢ per lb.

Sheet Zinc.—The scarcity of this material continues, and stocks in jobber's hands are of the lightest character. Many dealers have ceased to quote, being unable to secure the filling of their orders at the works, which are hard pushed to meet the current demand. Prices are somewhat higher than a week ago, and seem inclined to mount still further. For cash lots, where obtainable, the ruling price for Sheet Zinc is 6½¢, but a slight advance on this rate has had to be paid in some instances where requirements were

urgent. Small lots are quoted at 7¢ per lb.

Antimony.—Merely routine business has been effected and prices are variable. Fair quotations for small jobbing parcels are 8½¢ @ 9¢ for Cookson's and 8¢ for Hallett's.

Nickel.—Sellers' figures remain at 35¢ @ 40¢, according to quantity and terms.

Tin Plates.—While Tin Plates are the last branch of the metal trade to respond to the general advancing tendency in prices, the aspect of business in this line is decidedly on the mend. There has been quite a brisk movement in more than one line of material. Ordinary Cokes for canners' and can makers' use have secured quite a large amount of attention in the past week, and some substantial orders have been placed for future deliveries, although the prices named have been generally those now ruling. In a few cases, where contracts have been made for shipments rather far ahead, an advance of 7½¢ @ 10¢ per box has been asked and obtained. The supply of foreign Cokes is taxed to the utmost and the American product of like nature is figuring largely in the present movement, at prices which compete successfully with the imported article. The outlook for the canning trade is regarded as very bright, the recent cold snap not appearing to have worked harm to the fruit and vegetable crops to anything like the extent feared a week ago. The demand for American Terns from the roofing trade has been liberal in this section, and is likely to increase. American works are generally reported to be crowded with orders, some to as late as August. These Plates practically rule the market now, imported Roofing Plates being less and less in demand, as the domestic Plates are offered at prices close to and in some cases lower than those at which the foreign article can be imported. Prices for Americans are somewhat irregular. Bright Charcoal Plates are securing a fair share of trade. In view of the increased demand from consumers and of the fact that the output on the other side is restricted at the present time, an upward movement in prices is looked upon as more than likely to develop before long, provided the rapidly increasing output of the American works does not operate to the contrary.

A special London cable dispatch of May 22 to *The Iron Age* reports on the British Tin Plate market as follows: Tin Plate is in better demand and more business is doing. Buyers seem eager to place orders at late lowest rates, but makers are cautious and unwilling to sell forwards. The advance in Tin brought about a slight advance, but quotations are nominally unchanged. Prices, f.o.b. Wales, are as follows:

Bessemer Cokes, 1C 14 x 20	9 1/4 @ 9 3/4
Siemens Cokes, 1C 14 x 20	9 1/4 @ 9 6
Terns, 20 x 28	18 @ 22 8
Charcoals, 1C 14 x 20	11 @ 13 6

Sheet Iron.—Manufacturers' agents are in many cases unable to take any further orders for either Black or Galvanized Sheets for reasonably early de-

livery and are quoting only on orders for future delivery but not later than July 1. The leading mills are all reported as having their books filled to the date named. The outlook is excellent and intimations are given of a further advance in prices. A heavy demand prevails for Galvanized Sheets, of which jobbers in this district have none too large stocks. Prices for Galvanized Sheets are firm, and the conviction exists that they will shortly be higher. In sympathy with the increased firmness and scarcity of Galvanized Iron, the price of Roofers' Supplies made of this material, such as Eave Troughs, Elbows, Conductors, &c., is also developing considerable firmness, and an early advance is looked for. Small lots of No. 27 Common Iron, from store, are quoted at 2.80¢ $\frac{1}{2}$ lb. Galvanized Sheets are quoted at 75 and 5 ¢ @ 75 and 10 ¢ off, according to size of order and conditions of delivery.

Chicago Report.

Scrap.—The market is very promising and the values of Old Material are growing stronger. Dealers quote their buying prices as follows, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap.....	\$7.50	...
Machinery Cast.....	5.50	...
Malleable Cast.....	5.00	...

JOHN WILLIAMS, 554-556 West Twenty-seventh street, New York, makes a specialty of brass, bronze and wrought iron work in Gas Fixtures, Grilles and Architectural Work. He has recently finished the equipment of the Elevators and Railings in some large buildings.

CONDITION OF THE Hardware Trade.

A STRONGER and more confident tone characterizes the market. In our review of the situation last week reference was made to a perceptible improvement, both in the volume of business and in the general feeling, but since then there has been a still further improvement in both of these regards. The advance in Iron and Metals, together with the demand for higher wages, which in many cases has been yielded to, are significant features of the present condition, especially as they result in higher prices on many lines of heavy goods. In cases where no open announcement has been made of advanced prices manufacturers are withdrawing outstanding quotations, and particularly extras and special discounts which were named not long ago with a view to inducing business. There are, of course, many lines of goods in which no change has as yet taken place, the manufacturers of such lines not being as yet much affected by the advances in Iron and Metals and wages being still at former figures. Even in such goods there is, however, a better feeling, and manufacturers are watching the market closely and considering the feasibility of taking advantage of any favorable turn, hoping that before long there may be an opportunity for them to get more remunerative prices. It is noticeable that comparatively few orders are being placed on goods which have recently been advanced, buyers holding off a little to see whether or not the higher prices will be maintained. There is, however, a good deal of business in lines in which advances are expected. Buyers, as usual, make strenuous efforts to place orders at the old figures after advances have been made. Some manufacturers are experiencing the effects of their recent acceptance of large orders at low prices, some of them having their books loaded with orders which will occupy them for months to come at the prices which were based on lower raw material and lower wages than are likely to rule in the future. In view of the present state of things it is obviously wise for manufacturers to be exceedingly careful in accepting orders for future delivery at present prices. If the market should take an upward turn and business resume its former volume the manufacturers, on whom the stress of the depression has borne so heavily, will be in a position to get the benefit of the improved condition.

Advices from Chicago.—The severe frost of the past week seriously affected all branches of the Hardware trade. The demand for dairy goods and Tinware was decidedly checked, nevertheless the general demand increased, and the total volume of business the past week showed a good gain. Orders are large and more numerous, and fresh ventures in the retail trade are occurring, which call for new stocks. Jobbers have found so many advances on goods that they are instructing their salesmen not to quote except for immediate acceptance and to leave no open prices behind them. Advances made quite recently cover Agricultural Wrenches, Screws, Wrought Butts, Iron and Steel Squares, Bright Wire Goods, Strap and T-Hinges, Glue, Cowbell Straps, Ingot Copper, Copper Sheathing and Bottoms,

Soldering Coppers, General Copper Goods, Pig and Bar Lead, Shot, Wire Nails, Steel Cut Nails, Barb Wire, Fence Staples, Sheet Iron and Sheet Steel, Galvanized Iron and a few other articles. This shows how extensive the upward movement has become. Jobbers are reported by manufacturers' agents to be freely placing orders now for future delivery. Some of the contracts thus made are among the best ever known, showing great faith in the future. Spring frosts are not regarded as much of a menace to the trade. They annually occur, as farmers are always inclined to plant too early, taking their chances on the uncertainty of the weather. A special feature of this market recently has been the flurry in Sheet Zinc, caused by a sharp demand from the East. Jobbers' stocks have been almost depleted in consequence of this demand.

Notes on Prices.

Wire Nails.—The Wire Nail market shows the effect of the determination of the manufacturers not to accept orders which will occupy them later than May 31. Most of the mills are filled up to the extent of their capacity until that time and refuse to quote at all for future delivery. No further announcement has been made in regard to the negotiations between the manufacturers, but it is understood that they are progressing favorably, and that the matter may be consummated very soon. Small lots from store in New York are held at \$1.25.

Advices from Chicago.—It is now a matter of great difficulty to find any Wire Nails for sale by manufacturers at any price. All appear to be completely sold up for May, and they are not yet naming prices for June delivery. Buyers are making inquiries in every direction in the hope of finding somebody with a stock of nails. Jobbers advanced prices last week to \$1.15, and are now naming \$1.25 for small lots from stock, with no concessions for carloads. It is asserted that another advance will be made on or before June 1.

Cut Nails.—The Cut Nail market has a firmer tone and prices are higher. The mills are indisposed to accept orders for future delivery. Small lots from store in New York are held at \$1.10.

Advices from Chicago.—The demand for Cut Nails has been much better, in sympathy with the strength of the Wire Nail market. Everybody is expecting a material advance after June 1. Jobbers quote \$1 for small lots.

Barb Wire.—The Barb Wire market is characterized by a good deal of strength, and prices are higher. The demand is very active and the mills are finding it difficult to supply their customers as promptly as desired.

Advices from Chicago.—A very brisk trade is in progress, with buyers clamoring for deliveries. Mills in this vicinity report their product sold up to July 1. Jobbers are expected to advance their prices very shortly to conform with the higher rate asked by manufacturers.

Chain.—The Chain market is in a perceptibly improved condition. This is a line of goods which immediately feels the effect of any change in the iron market, and it is therefore characterized by a firmer tone. There has been no concerted action among the manufacturers, but on nearly all kinds of Chain advances have been made, and at the same time there

is a disposition on the part of jobbers to place orders early and much more freely than heretofore. The stocks in the hands of manufacturers and the trade are exceptionally light, there having been a general indisposition to carry heavier stocks than necessary in view of the downward tendency of the market for a long time. In view of the demand which is setting in and the small stocks on hand some well informed parties express the opinion that if the business should attain the anticipated volume the trade will find it difficult to get their orders filled promptly.

Rope.—There is considerable activity in the Cordage market, the volume of trade being good. Prices are also firmer, and slight advances have been made.

Copper Tacks and Nails.—We are advised by the Shelton Company, Derby, Conn., that they have withdrawn all outstanding prices for Copper Tacks and Nails. This action is taken in view of the advance in Copper, which requires an advance of about 3 cent per pound in the price of the goods. This line of goods has been selling at close prices and accordingly feels immediately any advance in the cost of the raw material.

Wrought Iron Pipe.—The market for Wrought Iron Pipe is characterized by a much better tone and prices have been advanced 2½ per cent.

M. D. Jones & Co.—The Wire Broome Fly Killer put on the market by M. D. Jones & Co., Boston, Mass., illustrated in our issue of the 18th inst., is sold to the trade at \$1.80 per dozen, subject to a discount of 40 per cent., and at \$12 per gross, net. Their Hose Menders are sold from the following list, which is subject to a discount of 33½ per cent. to the trade:

	Per doz.
1/4 inch.....	\$0.40
1/2 ".....	
1 ".....	

In lots of not less than one gross a discount of 40 per cent. is allowed.

Manufactured Copper.—In view of the advance in the price of raw material, the New Haven Copper Company, Seymour, Conn., announce the withdrawal of all quotations for Manufactured Copper. Similar action is taken by other manufacturers, and the market is higher and characterized by a firm tone.

Safety Chains.—The manufacturers of Safety Chains have adopted a new list, which bears date May 10, Holmes, Booth & Haydens, Plume & Atwood Mfg. Company, Wallace & Sons, Smith & Egge Mfg. Company and Bridgeport Chain Company unite in adopting this list, which corrects inequalities in the former list. It is subject to a discount of about 60 and 10 and 10 per cent.:

Glass.—The meeting held in Pittsburgh by the American Window Glass manufacturers resulted in the appointment of a Wage Committee and a general discussion on trade topics. The proposition to form an association did not meet with encouragement, so that nothing is likely to be done in this direction during the present fire. The subject of closing down all Glass plants on June 1 was brought before the meeting, but it did not receive the support of a majority of the manufacturers present. The demand for Glass is fair, but not satisfactory to either the maker or jobber. As far as can be learned the discounts on the new list are being well adhered to. The discounts which went into effect and apply to the new list adopted May 1, 1895, are as follows: Less than 100 boxes, 75 and 5 per cent.; discount; car lots, 75 and 10 per cent., and 1000 boxes, 75 and 10 and 5 per cent. discount. It is understood that large stocks of Plate Glass are held by jobbers throughout the country, so that the demand upon the manufacturers is light. They have not as yet issued a new price-list.

Old Metals.—Considerably more activity prevails in the demand for Old Metals of all kinds and prices show more firmness, especially in the line of Copper and Brass Stock, consequent on the recent rise in rates for raw materials. Scrap Iron of all kinds is in good request, but prices on small lots have not been advanced by dealers in this section. The following quotations represent the rates now paid by dealers in this city for lots of this character:

Heavy Copper.....	75¢
Light and fluted Copper.....	75¢
Heavy Brass.....	5¢
Light Brass.....	4¢
Lead.....	25¢
Zip Lead.....	25¢
No. 1 Pewter.....	95¢
No. 2 Pewter.....	45¢
Wrought Scrap Iron, gross	
ton.....	\$7.50 @ \$8.00
Heavy Cast Scrap.....	gross
ton.....	7.50 @ 8.00
Stove Plate Scrap.....	gross ton 5.00
Burnt Iron.....	gross ton 3.50

Old Rags, Paper, &c.—Business shows more activity, but prices remain at about their former level. Dealers' purchasing prices, New York delivery, rule as follows:

No. 1 White Rags.....	3¢ @ 3 1/2¢
No. 2 White Rags.....	2 1/2¢ @ 2 3/4¢
Mixed Rags.....	1 1/2¢ @ 1 3/4¢

Blues and Sds.....	1¢ @ 1 1/2¢
Hard Sized White Shavings.....	2 1/2¢ @ 2 3/4¢
No. 1 White Book Shavings.....	1 1/2¢ @ 1 3/4¢
No. 2 White Book Shavings.....	1¢ @ 1 1/2¢
Light Book Shavings.....	1¢ @ 1 1/2¢
No. 1 Mixed Shavings.....	3/4¢ @ 1¢
No. 2 Mixed Shavings.....	1/2¢ @ 3/4¢
No. 1 Printed Books.....	1¢ @ 1 1/2¢
Ordinary Mixed Books.....	1/2¢ @ 3/4¢
Newspapers.....	1/4¢ @ 3/4¢
No. 1 Manila Paper.....	2¢ @ 1¢
No. 2 Manila Paper.....	1 1/2¢ @ 1 3/4¢
Bogus Paper.....	1 1/2¢ @ 1 3/4¢
Common Paper.....	1 1/2¢ @ 1 3/4¢
Straw Chips.....	1/4¢ @ 1 1/2¢
Binders' Clippings.....	1/4¢ @ 1 1/2¢
June Butts.....	1 1/2¢ @ 1 3/4¢
No. 1 June Bagging.....	1¢ @ 1 1/2¢
Mixed Bagging.....	3/4¢ @ 1¢
No. 2 Bagging.....	2¢ @ 2 1/2¢
Hemp Twine.....	2¢ @ 2 1/2¢
Manila Rope.....	1 1/2¢ @ 1 3/4¢
June Rope.....	1 1/2¢ @ 1 3/4¢
Mixed Rope.....	1 1/2¢ @ 1 3/4¢

Old Rubber.—The following quotations represent about the current prices paid by New York dealers:

Car Springs, ton lots, 3¢ @ 3 1/2¢	
Rubber Shoes, carloads, delivered at factory, 4 1/2¢	
Rubber Shoes, less than carloads, 4 1/2¢	
White Wringer Rolls, 3¢ @ 3 1/2¢	
White Syringes, 3¢ @ 3 1/2¢

Spring Movings.

People whose business takes them to the down town district of New York City must have been struck of late by the unusual number of "May movings" among business men. Trucks loading and unloading office furniture have been in evidence on every block, and the frequency with which "Danger" signs on the sidewalks have necessitated unwilling excursions into the roadway on the part of pedestrians, in order to avoid suspended safes, cannot fail to have produced an impression of exceptional activity in the migration business. In truth, the spring changes of offices in New York this year have been phenomenally numerous. They are, too, specially interesting from the fact that the moves have been almost invariably made out of old fashioned, unimproved business houses into the more commodious and convenient quarters offered by the huge new many storied office buildings which are rising on all sides. There is a marked tendency among the business men of to-day to occupy more luxurious offices, where the grind of hard work can be carried on under more cheerful conditions than were to be obtained in the old, dingy buildings so thickly tenanted a few years ago. Consequently as fast as each new, big business structure is finished its multitudinous offices are filled up by transfers from its more unassuming neighbors. Real estate agents say that there is practically no demand for offices in the old buildings of lower New York. Some of this class on the side streets are not sufficiently occupied to pay taxes. Tenants are leaving them, and they have become anything but remunerative properties.

Changing New York.

As a consequence, these old fashioned buildings are being fast pulled down and on their sites sky scraping modern structures of greatly increased capacity are being put up. Broadway, from

Fulton street down to the Battery, will, it is predicted, soon become one long stretch of tall up-to-date business buildings. Most of the old houses now standing in that district are already doomed and plans are being prepared for their successors. In a few years, those who knew this portion of New York as it was 10 or 15 years ago will hardly recognize it as the same locality. Moreover, this wonderful change is not confined to the lower part of Broadway. The process of transformation is going on all over the city. Churches, hospitals, schools and similar buildings in the lower section are one by one giving way to the needs of business and moving further up town. Hotels, clubs and fashionable residences are doing likewise, and their places are being taken by huge office buildings, such as that now building on the site of the historic old Metropolitan Hotel and Niblo's Garden, on Broadway. Even St. Luke's Hospital, as high up town as Fifty fourth street, has been removed still further north to Morningside Heights, where, with the new buildings of Columbia College and the great Cathedral of St. John the Divine, a magnificent group of buildings is slowly rising. New York, in fine, is fast becoming architecturally a new city, and a far handsomer one.

Art for the Artisan.

All through the various discussions regarding the opening of public libraries and art museums on Sunday there runs an undercurrent of questioning whether, after all, the workman, for whom these advantages are proposed, really and sincerely desires them; whether, in fact, he is seeking and longing for this opportunity to improve himself during the hours which are his own. Certainly the rapid growth in the circulation of many trade papers, the vast increase in the number and decrease in the price of some of the monthly magazines and the great number of low priced books now for sale are evidences that the wealthy and the highly educated are not alone deriving benefit from these changes that place good literature within the reach of all. It is certain that the workman of to-day has within his reach a vast store of knowledge and art that would make envious the scholar of olden time, and it must be to a great degree through his acquaintance with and gradually acquired love for good literature that a better appreciation of art must come. We are not yet done talking about the benefits of the World's Fair in the creation of artistic ideas and ideals in the minds of many to whom art never appealed before. A man is not here

upon earth merely for what he can get out of it, neither should he fall back on the assumption that the world owes him a living. But he can best do his share in his own elevation and in that of those around him by reaching a little outside of his daily routine, by trying to realize and absorb a little of the higher side of life. Thus he is elevated through good books and good pictures. In almost every city the public library offers him freely the one and the art museum the other, or, if not freely, at least at very small expense, while the illustrations in the best class of periodical literature of the day are such as to make no mean substitute for the real paintings and statues, the fine buildings and the beautiful parks a man may long to see.

Much attention has lately been paid by the Treasury to the prevention of fraudulent undervaluation of imported goods. The special service of Treasury agents in Europe, instituted last year, has proved useful in several cases in discovering fraudulent collusion between jobbers and importers. These agents are making exhaustive inquiries in the leading manufacturing cities of Europe, and their reports are carefully examined at the Treasury Department and forwarded to the Board of General Appraisers, at New York, for comparison with the invoice values furnished by the importers and their agents. The effect of this action on the part of the Government is said to have done a great deal in curtailing the amount of frauds on the revenue.

Statistics compiled by an English authority of the railways of the world indicate that the mileage is 406,416, or 1 mile of railway to every 3516 inhabitants. The smallest railway mileage is possessed by Puerto Rico, which has only 11 miles; the largest by the United States, which, with 174,784 miles at the close of 1893, was far ahead of any other country. Next, but at a great interval, comes Germany, with 27,455 miles, followed by France, with 24,018 miles. The United Kingdom comes fourth with 20,325 miles, and Russia fifth with 19,653 miles. In Europe there are altogether 144,380 miles of railway; in North and South America 218,950 miles; in Asia only 23,290 miles, of which 17,768 miles are in British India; in Australia 12,685 miles; and in Africa 7212 miles. The islands of Malta, Jersey and Man have 68 miles; Hawaii has 58 miles, and Persia only 24.

A Philadelphia Insurance institution has undertaken a new field in the insurance of buildings against falls or collapses, and issues special policies to cover this hazard. They include the loss or damage occasioned by the fall of buildings from any cause other than fire, explosions of all kinds, bursting or overflow of water pipes, tornadoes, cyclones, or destruction or damage by mobs, strikers or rioters.

THE LETTER BOX.

Measure Patterns.

From O. T. R., Chicago.—Many years ago I devised a scheme for recording the dimensions of patterns in such a manner that the patterns could be described accurately and with little labor. As an example I will present a table giving the dimensions for a set of measure patterns. The method of obtaining the

Measure Patterns.—Fig. 1.—Method of Obtaining Measure Patterns from Dimensions in the Table.

patterns is shown in Fig. 1 and the table of dimensions is presented below. Let us obtain the pattern for a half-pint measure. Referring to the table,

Table Giving Dimensions for Obtaining Measure Patterns.

	Number of inches		
	A to B	A to C	A to D
1 gill measure.....	24 3/16	26 3/4	6 3/4
1 1/2 pint measure.....	39 1/4	42 5/8	9 5/8
1 pint measure.....	51 5/8	56 1/16	12 1/2
1 quart measure.....	64 5/8	69 1/16	15 1/2
2 quart measure.....	78 1/8	83 1/16	18 1/2
1 gallon measure.....	92 1/8	97 1/16	21 1/2

the distance from A to B is given as 9 3/4 inches. The compasses are set to this measurement, and with A as center the arc B E is struck. With the same center and A to C in the second column as radius, which is 12 1/2 inches, the second arc, C to D, is struck. In practice, these two arcs can be extended either way indefinitely. From any point, as C, draw a line to the center A. Then lay the heel of the square at C and mark off the distance from C to D, as shown in the third column. This distance is 9 3/4 inches, which indicates the point D. From D draw a line to A. If desired the compasses can be set to the distance indicated in the third column, and from C as center an arc struck cutting C D in D. Edges for joining are to be allowed only on C B and D E. The gill measure has an edge turned on the top, while the 1-pint, pint, quart and 2-quart have No. 14 wire in the top. The bottoms of the gill, 1-pint, pint and quart are "snapped" on, while the 2-quart and gallon have the usual double seamed bottoms. The usual al-

lowances for these edges have been made on the patterns.

When making measures it is convenient to have some means of testing their accuracy. As shown in Fig. 2, a

Fig. 2.—Half Gallon, Circumference 11 Inches.

cylinder 3 1/2 inches in diameter and 12 inches high, with a circumference of 11 inches, will hold almost exactly 2 quarts, or 1 gallon. Consequently a cylinder

Fig. 3.—Quart, Circumference 7.85 Inches.

of the above dimensions can be marked as shown in the engraving, and used for testing measures above 1 pint; the cylinder being filled twice would equal 1 gallon. If desired, separate cylinders can be made for the quart and pint.

Another cylinder is shown in Fig. 3, holding 1 quart, the excess being about one half of 1 per cent., which is very slight. The cylinder shown in Fig. 3 can be marked as indicated so as to give the pint, 1-pint and gill measure. That the cylinder should hold just the quantity indicated, when made of sheet metal, the material should be cut three and a half times its thickness longer than the indicated circumference. It may be found convenient to allow a small edge for joining and solder the seam. The bottom can be "snapped" on and soldered, as the double seam is rather uncertain in the amount of material it consumes. The top of the testing cylinder can be strengthened by soldering on a circular hoop of locked tin.

Material for Windmill.

From H. A. H., Wellesley, Mass.—In regard to the windmill illustrated in *The Metal Worker* of May 11, I would like to ask how I can obtain the iron flanges, if it is necessary to have them cast, and what kind of wood is best suited for making patterns? Also, in making the fans of sheet iron, what thickness would be desirable?

Answer.—The flanges may be obtained through the pipe fitting trade in Boston or New York, or, what is better, decide how many arms the mill will have, and make a pattern of the flange with arms as a spider, of pine wood. Have it cast and tapped. Gas fitters have the tools for this purpose. It is not necessary to have cast iron flanges; any clever blacksmith can make the spider flange of wrought iron and also a skeleton flange for carrying the mill and tail board. The blades may be made of No. 14 sheet iron.

Check Valve on Boiler Supply.

From R. S. J., Hoboken, N. J.—I notice in *The Metal Worker* of May 18 the letter of "H. H.," in answer to an inquiry from "P. S. J.," about a "Kitchen Boiler Below Range," in which he recommends a check valve on the cold water supply to the boiler. He also recommends an expansion pipe from the top of the boiler, with a safety valve attached. In the first place, I see no benefit that could possibly be derived from such an attachment to aid in securing circulation. In the second place, I can see an element of danger and a possibility of damage in the use of a check valve on the boiler supply. If the system was filled with water and there was no fire in the range, a considerable expansion would take place in the water in the system when it became hot. His expansion pipe and safety valve will take care of this expansion when they work; but it is not an uncommon thing for a safety valve to fail to open at the right time, and then a pressure would be exerted on the boiler, water back, piping and faucets, due to the expansion of the water, that

would force something to give way, and in all probability the water back would burst. If the check valve is used at all it would be needed to prevent water from running out of the system or being siphoned out in case the water pressure in the street main should fail to rise and supply the boiler. If it is placed to prevent hot water from backing into the main, a small notch may be filed in the edge of the check valve or a small hole drilled through it. This would prevent any considerable amount of hot water escaping to the main, and would avoid the expense of the safety valve and expansion pipe, as the expansion would find vent through the notch or hole. His first suggestion would be of far more use to "P. S. J.," and as the top of the boiler is only 18 inches below the water back, it is quite probable that a circulation of water will follow such a method of piping.

A Second Story Register Box.

From M. W., Boston.—The usual construction of the register box used on the second floor of a furnace stack presents a great deal of friction and

A Second Story Register Box.—Fig. 1.—The Usual Construction.

materially reduces the flow of air to the room to be heated. Sometimes just enough obstruction is presented to cause a failure to heat. The accompanying sketches may start some aspiring furnaceman in the right direction.

In Fig. 1 let A represent the stack, B the connecting collar and C the floor register box as usually constructed for

Fig. 2.—Improved Construction.

the second story. The warm air strikes against the top of stack A, and after being abruptly stopped passes through the collar B into the box C. At this point more confusion arises, as there is no guiding star to indicate that the air should pass upward. The furnaceman depends upon the air to find its way through the register, but does not assist it in any way other than by providing pipes for its passage. If the stack D had a curved top, as shown by J K in Fig. 2, the warm air would be deflected through the collar D. The opposite side of the register box being curved, as indicated by G I H, the air

would be deflected through the register. Perhaps the same result would be obtained by having the side made on an angle, as indicated by the dotted line H G.

Milky Water from Boiler.

From A. J., Wilkes-Barre, Pa.—I presume that when the water mentioned by "H. D. T." in *The Metal Worker* of May 25 has remained in a vessel for a few minutes it becomes clear and transparent. If my supposition is correct the milky appearance is due to the water being full of small globules of steam. This condition is seldom found except with heavy firing or with a large water back when but little water has been used for a time. This enables all of the water in the boiler to be at very nearly an even temperature. The boiler being subject to a pressure from the city mains, sometimes as much as 80 pounds, enables the water to be heated to several degrees above the boiling point, and immediately on opening the faucet this pressure is very materially reduced, enabling the water in the boiler and piping to expand into steam. It runs in this condition with the milky appearance mentioned, and as all of the steam cannot escape instantly some will be carried to the vessel and as it gradually passes off the water will become clear.

Furnace Heating with a Fan.

From MANUFACTURER, Pa.—I have read the article in *The Metal Worker* of May 25 on furnace heating with a fan with considerable interest. It has been customary with our house to keep in close touch with the details of furnace setting, and I am free to admit that the system described is a new departure, inasmuch as experiments in this direction in the past have not been duplicated. The thoughts which have come to me are, first, that all important and ever present feature of cost. Furnacemen already know that it is very difficult to get a price that is required for a really good job of furnace work after the methods which are in general use; and it strikes me that it would be no small job in many cases to induce a school board, church committee, county commissioner or other body in charge of the erection of a public building to go to the expense of an electric motor, a line of shafting and a fan. It is very difficult to induce the "powers that be" to provide an adequate means of ventilation; and it is not as thoroughly recognized as it should be that successful furnace heating depends on getting the air out of the building after it has lost some of its original warmth and has deteriorated in quality, so as to make room for fresher air laden with heat. I heartily commend the system shown, and hope it will be used widely. The only criticisms that could be offered to it are in reference to its details and not to the principle of its operation or the beneficial results which are sure to follow its use. Grouping the furnaces in one spot is new to the furnaceman; and the dropping of an air pipe 15 feet and then running the pipe nearly 100 feet before the last register is reached would be impossible without the use of a fan, and then, unless the pipes are covered, so much piping must lose considerable heat. I can therefore see no good reason why the furnaces cannot be located nearer the work to be performed, the cold air supply ducts branching from the fan chamber and running to the furnaces wherever they may be located. It would be interesting to learn the amount of coal that is used in heating

this building for the Sunday service so that a comparison can be made of the amount used in the heating of similar buildings with hot air furnaces set in the customary manner. From the size of the fire pot and description of the furnace as used in this plant, it is more than probable that two of these furnaces would heat the building on the old plan without difficulty; and the cost of such a plant would be a great deal less than that described. Of course, each reader of *The Metal Worker* can estimate the cost of the plant given, but it would add to the interest of the article had that item been supplied. I think all manufacturers have felt more or less the intrusion of steam and hot water in their field. As a rule, these plants for heating cost very much more than a furnace heating plant, and it seems reasonable to suppose that if the price would be paid for the steam heating plant it is only necessary to explain the benefits of the fan system to secure a figure which will enable its installation.

Kitchen Boiler Below Range.

From W. T. I., Warren, Ohio.—In *The Metal Worker* of May 11 "P. S. J." asks for a plan to cause a circulation

Kitchen Boiler Below Range.

of water through a range and water tank, and I submit herewith a sketch which will show how to produce the desired result. The pipe which is connected to the upper opening in the water back should extend toward the ceiling above the top of the range about 4 feet or more, if there is room, and then connect to a return bend, and at the highest part of the return bend put in an air valve, to let out the air that will accumulate in the pipes and prevent them from becoming air bound. As the water becomes heated it rises, and the pipe toward the ceiling enables it to continue rising until it reaches the return bend, when it begins to cool and fall, and if there are no traps it will continue to fall till it reaches the bottom of the tank. The cooler water goes in at the lower opening of the water back because the hot water has gone out at the top and the circulation is complete. Care must be taken to avoid all dead levels within the circuit. This is simply like a case in hot water house heating where the radiator is situated below the fire box. A case that we have in our own house gives excellent satisfaction.

How Shall the Main Be Run?

From S. W. A., Omaha, Neb.—In answer to the inquiry of "S. F.," New Jersey, in *The Metal Worker* of May 18, as to how the main shall be run, the only feasible way I can conceive in connection with the diagram shown is to tap the boiler 2 feet from the bottom of the cellar, provided the boiler is so constructed that the water will be hot at that point. This will leave space below the flow pipe, which is to be connected with the opening tapped, so that the return pipe can be brought back and connected with the boiler at a point lower than the flow pipe. This will allow 6 inches raise to 100 feet for both the flow and return mains. The size of the mains should be $1\frac{1}{2}$ inches, and they should be covered.

Filling a Tank.

From A. E. W., New Britain, Conn.—We have a 52-gallon range boiler connected as shown in the accompanying sketch, which is used for storing gasoline. It is filled by a rubber hose connected to a barrel raised about a foot above the tank. I am told that the tank will not fill as quickly when connected as shown by the solid lines as it will if connected as shown by the dotted lines. It is claimed that it will

Filling a Tank.

fill quickly until the level in the tank shown by the dotted portion is reached; then it will fill slower, as the inflowing oil has to overcome the weight of oil against it. I claim that it fills just as fast connected as shown by the solid lines less the friction, providing the vent is equal in both cases. Will you please settle this dispute?

Answer.—The head or height of the fluid between the supply level and the tank level would govern the rapidity of the flow, less the friction of the pipe; and the point at which the supply enters the tank is practically immaterial.

Connecting Drain Pipe.

From M. S. E., Westminster, Md.—Will *The Metal Worker* please inform me whether Portland cement is the best cement to use for laying terra cotta sewer pipe and how it should be mixed? How are these tile generally fixed against the wall so that water-scotting may be placed around it, and how are the pipes held in position until the cement has set?

Answer.—Any first-class hydraulic cement may be used for connecting

terra cotta sewer pipes. The cement should be mixed with about the same bulk of clean sharp sand, although if good Portland cement is used a slightly larger proportion of sand may be added. Only such quantity of the sand and cement should be wetted as is needed for immediate use, and no more water should be used than will make the cement plastic. If in use the cement begins to harden it is best to discard it and mix a new batch, as it is liable to crack in setting if it is wetted down thin again and used. Whether the pipe is placed vertically or placed horizontally, the connection should not be made until the pipe is firmly supported. When used against an upright wall a good job is made by drilling a hole in the wall with a chisel and driving a wooden plug into it. Large wrought iron pipe hooks are then driven into the plug and bent around the pipe tightly to hold it securely in place. Sometimes a hole is drilled in the wall on each side of the pipe, a band being placed over it, and a hole provided in each end of the band for fastening to the wooden plug by means of a large spike. When laid horizontally the bell end of the pipe should always rest on a firm foundation either of well tamped earth or stone. In order to prevent the spigot end of the pipe lying flat against the bell at the bottom it should be supported so that there will be an equal space all around the pipe in the bell for the cement.

The H. B. Smith Company, 133, 135, 137 Centre street, New York, have completed the annual refreshing of their sample room, and a handsome crimson Brussels carpet now covers a platform in the center of the room, on which are arranged the various heights of their line of Imperial, Champion, Royal, Union and Reed radiators, handsomely ornamented. On one side of their showroom a line of their popular Cottage boilers is shown, commencing with 00 and going up to the largest size. Some are shown for hot water and others are arranged for steam. All are painted white and alternately decorated with bands of gilt and aluminum bronze. At the back of the sample room three sizes of the Mills sectional steam boilers are shown. At the other side of the building two sizes each of the Mercer and Gold boilers are shown painted in different colors and ornamented with gilt. The goods make a handsome appearance, which is said by the company only to be surpassed by the handsome work they perform when in operation.

The Orford Copper Company of Bergenport, N. J., are now making electrolytic nickel of exceptional purity. The metal is nearly chemically pure.

A report of the Canadian Minister of Marine and Fisheries, lately laid before the Dominion Parliament, shows that the value of registered tonnage of Canadian vessels is \$26,088,720. Last year 326 vessels, having a tonnage of 21,243, were built in Canada. There are now on the registry books of the Dominion 7245 vessels, representing 869,462 tons.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

H. B. MIDDLEBROOK, Bridgeport, Conn., has the contract for the plumbing in the new cottage of James A. Wilson.

The New Britain, Conn., School Board have accepted plans for a three-story school building which is to be 126 x 168 feet. It will have a system of heating and ventilation.

OLDS & WHIFFLE, Hartford, Conn., have the contract for plumbing 12 new bath-rooms at the Retreat for the Insane.

THE CONTRACT for the heating apparatus for the Federal Building at New Haven, Conn, has been awarded to the James Curran Mfg. Company of New York City, at \$4150.

EDWARD WHITFIELD of Greensburg, Pa., has the contract for the plumbing and hot water heating for the residence of J. Peterson, Ligonier.

SEALED PROPOSALS will be received at the office of the Supervising Architect at Washington, D. C., until June 12 for work including the plumbing of the United States Post Office Building at Burlington, Iowa. Drawings and specifications may be obtained from the Supervising Architect at Washington or from the Superintendent at Burlington.

THE KERNAN FURNACE COMPANY of Utica, N. Y., have been awarded the contract for heating and ventilating the new Verona Union School Building.

THE FULLER & WARREN COMPANY, 157 and 159 Lake Street, Chicago, have the contract for warm air heating, ventilating and furnishing sanitary cremating closets for the ten-room High School at Goshen, Ind.

J. CARR, Troy, N. J., has the contract for the heating and plumbing for the Roy mansion.

THE BOARD OF ALDERMEN of Malden, Mass., have appropriated \$,000 for improving the heating, ventilating and sanitary condition of Converse, Emerson and Judson schools.

THE CONTRACT for the heating and ventilating apparatus for the Public Building at Lima, Ohio, was awarded to Whitehead & Lewis of Detroit at their bid of \$2600.

GODFREY & ALLEN are doing the plumbing and steam fitting in the new buildings of G. E. Webster and Lewis Fortier.

THE PLUMBING FIRM of D. Ahern & Son of Fond du Lac, Wis., have been awarded the contract for an extensive job in the leading hotel at Oconto, and J. F. Ahern is now in Oconto superintending the work.

SHANNON & McNAMARA, Denver, Col., have the contract for refitting the plumbing in the fire station at Twenty-sixth and Lincoln avenues.

BLANCHARD & BRADEEN, Old Town, Maine, are busy plumbing the new Perry Building. They are also doing work for Wing & Engel.

LEE BROS., Concord, N. H., have been awarded the contract for plumbing the new school building.

CLAYTON & MILLER, 477 West North avenue, Chicago, have the contract for the plumbing and drainage in the apartment building of William Feggars, 249 West Division street.

BYRNE & RYAN, 254 Forty-third street, Chicago, are to do the plumbing and drainage in the four apartment buildings of Duplessy Bros., Prairie avenue and Forty-sixth street.

J. C. CEDERHOLM, 87 West Ohio street, Chicago, has the contract for the plumbing and drainage in the apartment building of Reynertson Bros., 325 Hermitage avenue.

CHARLES UHER, 524 West Eighteenth street, Chicago, is to do the plumbing and drainage in the flat building of H. Johnson, 1000 Fifty-second street.

FRANK MEEK, 485 West Eighteenth street, Chicago, is to do the plumbing and drainage in the flat building of James Silaby, 1059 Kedzie avenue.

HENRY & CLARK, 5738 Wabash avenue, Chicago, have the contract for the plumbing

ing and drainage in the flat building of C. Silkenat, 5411 Armour avenue.

J. J. CURTIN, 4929 South Ashland avenue, Chicago, is to do the plumbing and drainage in the flat building of C. Kaske, 4828 Diager street.

WILSON & WILK, 3907 Cottage Grove avenue, Chicago, have the contract for the plumbing and drainage in the residence of W. Spenglers, Ewing place.

E. L. FRANSTED, 443 West Randolph street, Chicago, is to do the plumbing and drainage in the flat building of O. Tuft, West Adams and Forty-fourth streets.

MORRIS BROS., 3442 South Halsted street, Chicago, are to do the plumbing and drainage in the flat building of George Harper, 8506 Parnell avenue.

P. H. GUNDERMANN, 889 North Halsted street, Chicago, has the contract for the plumbing and drainage in the factory building of F. Diesel, Fortieth street and Stewart avenue.

A. C. SMITH & Co. of West Newburg, N. Y., received the contract for the new plumbing work of the United States Hotel, consisting of modern bathrooms, steam cooking utensils, French ranges, power boiler and laundry work, all of which, when completed, will be a model plant.

THE CONTRACT for plumbing the Summit House, on Mt. Washington, has been awarded to the C. W. Williams Company, Concord, N. H.

P. J. MURPHY of Newport, R. I., has taken an extensive contract at the Conant Park Hotel. The house is to be fitted with new plumbing, porcelain baths, marble basins, siphon water closets, with nickel plated pipes.

THE SPERL HEATER COMPANY of Carbondale, Pa., are putting steam heating apparatus in the new building being erected by the Odd Fellows.

SEALED PROPOSALS will be received by W. A. Scherff, secretary of the Board of Directors of the Independent School District of Fort Madison, Iowa, until 2 o'clock p.m. June 1, 1895, for heating and ventilating the two school buildings in the west part of the said city, known as the Union avenue and Richardson Building.

W. B. CASSEN, Meriden, Conn., has the contract to do the plumbing in the new \$5000 building of John W. Coe.

THE WALKER & PRATT FIRM, COMPANY, Boston, Mass., have been given the contract for heating and ventilating Mrs. E. I. Brown's block. The indirect heating system will be used.

THE HARTFORD LIFE & ANNUITY INSURANCE COMPANY, Hartford, Conn., will use either steam or hot water heating in their new five-story building and will have a fine system of plumbing.

GRISWOLD, RICHMOND, GLOCK & Co., Meriden, Conn., have the contract for heating in the new residence for F. W. Thompson and H. A. Wood.

T. P. LEACH, Middletown, Conn., is to erect a fine new residence to have a first-class system of heating and plumbing.

F. C. WEYANT, New Britain, Conn., has the contract for the plumbing in the new building being erected by A. A. Lyman.

NOTRE DAME CHURCH, at Pittsfield, Mass., is to erect a new building, to be 133 x 76 feet. It will have a heating system.

TWO NEW SCHOOLHOUSES are to be built at Pittsfield, Mass., one to cost \$25,000 and the other \$32,000, each to have a system of heating and ventilation.

THE CONTRACT has been awarded for a \$45,000 high school building at Northampton, Mass. The contracts for the heating, ventilation and plumbing have not yet been awarded.

SEALED PROPOSALS addressed to Ira C. Miles, Edwards, N. Y., until June 8, 1895, after that date at Canton, N. Y., will be received by the Board of Supervisors of St. Lawrence County until June 11, 1895, for the construction of a system of steam heating in the St. Lawrence County Poor House at Canton, N. Y.

THE BROADWAY FIRM of A. C. Smith & Co., Newburgh, N. Y., received the contract for the steam fitting at the United States Hotel. The firm recently received

the plumbing contract for the new annex, the figure being about \$2200. The steam heating contract is for the entire building and is about one-half as much again as the plumbing contract.

THE board of public works of Pittsfield, Mass., awarded the contract for heating the new addition to the city hall to Robbins & Gamwell.

LOFTUS & Co., North Adams, Mass., have the contract for heating the Cranesville School at \$2200.

MRS. BENJAMIN WOODSIDE is erecting a \$5000 cottage at Berry's Mills, Georgetown, Maine, and J. A. Winslow & Son are doing the plumbing.

R. T. FORD, Rochester, N. Y., has been awarded by the City Property Committee of the Common Council of Rochester the contract for the plumbing of the City Hall building. The firm's bid was \$1330.

THE LOCKPORT DISTRICT STEAM COMPANY, Lockport, have been awarded a contract to put in a steam heating plant at Danville, Ill. Price, \$20,000.

BIDS for the heating apparatus for the Government Building at Rockford, Ill., were opened at Washington, and the Charles E. King Heating Company of Milwaukee, who made the lowest bid, \$2375, will be awarded the contract.

THE CONTRACT for heating the McManus Building at Davenport, Ia., has been awarded to the Davenport Steam Heating Company and the plumbing contract to Griffith & Diedrichsen, both of Davenport.

THE CONTRACT for heating the city building of Scranton, Pa., was awarded to the Economy Steam Heat Company. The contract price per annum is \$1337. W. P. Connell & Son received the contract for changing the heating system of the city hall for \$664.

GODFREY & ALLEN, Oldtown, Maine, have been doing quite an extensive job of plumbing at the residence of S. C. Higgins, at Costigan, and this firm have also been plumbing at the Odd Fellows' Block.

A. M. MAYPOLE, 816 Van Buren street, Chicago, is to do the plumbing and drainage in the residence of C. Vibert, 1189 Flournoy street.

M. G. BROOKS, 1111 West Harrison street, Chicago, has the contract for the plumbing and drainage in the three flat buildings of S. A. Kent, Wabash avenue and Twentieth street.

THE J. F. ALLES PLUMBING COMPANY, 233 Lincoln avenue, Chicago, are to do the plumbing and drainage in the flat building of G. Becken, 1148 North Halsted street.

M. J. CORBOY, 78 Dearborn street, Chicago, has the contract for the plumbing and drainage in the flat building of E. F. Ingalls, Grand Boulevard.

T. E. O'MALLEY, 215 Wells street, Chicago, is to do the plumbing and drainage in the two apartment buildings of Sullivan & Daley, 143 and 145 Sedgwick street.

HENRY BAUER, 232 North avenue, Chicago, has the contract for the plumbing and drainage in the flat building of N. Lukas, Eugenia, near Sedgwick street.

SMITH & DORNEY, 1046 Northwestern avenue, Chicago, have the contract for the plumbing and drainage in the residence of M. Pregier, Myrtle avenue, near Garden street.

J. W. PLUMSTED, 5090 Atlantic street, Chicago, has the contract for the plumbing and drainage in the flat building of M. Shon, 4217 Union avenue.

J. F. KENDRICK, 3934 State street, Chicago, is to do the plumbing and drainage in the apartment building of J. R. Taylor, Fifth street and Calumet avenue.

FARRELL BROS., Mt. Carmel, Pa.; James Kane, Doylestown, Pa., and Charles E. Bond, Newark, N. J., are installing heating plants in which the Volunteer and All Right boilers will be used.

THE building to be erected at Duluth, Minn., on the site of the old Board of Trade will be known as the "Lonsdale." N. C. Harvey secured the contract for the plumbing at about \$10,000.

THE asylum committee of supervisors at Chippewa, Wis., let the contract for the heating apparatus of the new asylum to J. P. Fox of Eau Claire, at \$4495.

An East Indian Trade School.

It is interesting to note that the movement in favor of establishing trade schools for the benefit of the native craftsmen of India, to which reference was made in a recent issue of *The Metal Worker*, has already borne fruit. In a late number of the *Indian Textile Journal* of Bombay an account is given of the annual presentation of prizes at the Victoria Jubilee Technical Institute, in that city, at which the announcement was made that a trade school department was to be added to the work of the institute. This establishment was founded and endowed in 1887, as a memorial of the fiftieth year of the reign of the Empress of India, by Sir Dinslaw Petit, a wealthy and beneficent Parsee merchant of Bombay, for the purpose of giving a technical education to the young natives of the city. Now the original donor has given a further sum of 40,000 rupees in order to provide a school for the teaching of trades. Enameling and working in sheet metals are proposed to be taught, as well as plumbing, at the outset, and it is expected that further trades will be added if the school proves successful.

Commenting editorially on the new departure, the *Textile Journal* has the following remarks: "Instruction in the working of tin plate and sheet metal is such a palpable necessity that it almost recommends itself. Ordinary tin plate working has been taken in hand in India by men of no trade at all, and the work has been degraded to the very lowest point. Such tools as are to be found in the smallest tinker's shop in Europe are of the rarest occurrence here. In work on sheet iron, copper or brass, although the Indian artificer is very clever at hammering and brazing, he has still to learn to work to exact dimensions. We therefore feel sure that instruction in this class of work may be added with advantage to the list of subjects taught at the institute. With regard to plumbing we cordially echo the appeal of Mr. Acworth. The need for instruction in plumbing is urgent, and the course of instruction, if well carried out, will prove one of the most interesting of all, calling as it does upon every faculty of the student, and affording much scope for both skill and judgment, for it includes a very large portion of the art of making joints with a great variety of materials."

The proposal to teach enameling does not find favor with the journal quoted, which argues that instruction in this branch of the trade would involve a heavy outlay with little or no prospective benefit. There is no demand, it says, for enameled cooking ware in India, where the native cooks are in the habit of placing their empty cooking pots on the fire and when they are heated to a temperature of 300° to 400° of throwing fat or water into them. No enamel or tinned lining would stand such treatment.

The Canadian Bridge Company have secured a large contract from the Atlantic & Lake Superior Railroad for the construction of all the steel bridges on the unfinished portion of the line between Chaudiere Junction and Yamaska. These are somewhat numerous, including one of 1900 feet in length over the St. Francis River, another 600 feet in length over the Nicolet River, and one of 1300 feet at Becancour. Besides these, there are bridges over the Gentilly River, the DuChene River and the Chaudiere River. The contract involves over \$250,000.

ROOFING AND CORNICE.

Conductor Heads.—IV.

BY CORNICE WORKER.

Patterns for a Circular Leader Head.

In Fig. 25 is shown the plan and elevation required for obtaining the patterns for a circular leader head. Let A B C D represent the front elevation. Draw the center line E X', extending it indefinitely, as shown by E K. At right angles to E K draw the line X Y, intersecting the center line E K at M.

the back must be obtained. For this pattern proceed as follows: Space the profile B D in front elevation, Fig. 25, into any convenient number of parts, as shown by the small figures 1, 2, 3, 4, 5, 6, 7 and 8.

Now at right angles to the center line E K, Fig. 25, draw lines from the points of intersections on the profile B D, as shown; from these same points in the profile B D, Fig. 25, drop lines parallel to the center line E K, until they intersect the center line X Y in plan. Then with M in plan as center

by 2, 3, 4, 5, 6, 5, 4, 3, 2, will be the required pattern for the back of the head. Laps are allowed for soldering, as shown by the dotted lines. Before obtaining the patterns for the flaring strips draw a profile, as shown in Fig. 27, which shows the method of constructing the flanges. To develop the pattern for the flaring strip, shown from 2 to 3 in the profile B D, front elevation, Fig. 25, produce the line 2 3 until it intersects the center line E X', as shown at E. Now, with A, Fig. 28, as center and E 3 of the elevation as

Fig. 25.—Plan and Elevation of a Plain Round Leader Head.

Fig. 26.—Pattern of Rear of Leader Head.

Fig. 27.—Method of Constructing Laps or Flanges.

Fig. 28.—Pattern for Flare Shown by 2 3 in Elevation, Fig. 25.

CONDUCTOR HEADS.—PATTERNS FOR A CIRCULAR HEAD.

With M as center strike the circle J, representing the plan of the pipe. From the numbered bands in the profile B D in elevation drop lines parallel to E K, intersecting the line X Y at points Y', Y'', O and M'. With M in the plan as center, and with radii M M', M O, M Y, M Y' and M Y'' describe arcs, as shown, intersecting the back of head G H, which lies against the wall line U, V, thus completing the plan of the head. It should be understood that the front elevation in Fig. 25 indicates the section through X Y in plan, and would not be the pattern for the back of the head shown by G H. The length of G H being less than a section on X Y, a special pattern for

and with the various intersections on the center line X Y as radii describe arcs intersecting the line G H in plan. It will be noticed that the intersections obtained on the line G H in plan are numbered to correspond with those on the profile B D in elevation. Referring to Fig. 26, draw any line, as G' H', upon which transfer the intersections obtained on the line G H in plan in Fig. 25, as shown by the small figures in Fig. 26.

At right angles to G' H', Fig. 26, and from the points indicated by the small figures, draw lines upward, intersecting lines of similar numbers drawn from the profile B D. A line traced through these intersections, as shown

radius, describe the arc D B, Fig. 28. Now divide the arc Y', shown in plan, Fig. 25, corresponding to the point 3 in elevation, into an equal number of parts, as indicated by the small figures 0 to 20. Transfer these 20 divisions to the arc D B, Fig. 28. Draw a line from D to the center A and from A to B, as shown. Now, with E 2 of the elevation, Fig. 25, as radius, and A of Fig. 28 as center, strike an arc indefinitely. From the point 20 in plan draw a line to the center M, intersecting the arc Y, as shown at L. Then will the distance from L to 1' 2' in plan indicate the distance of its intersection with the flat back from the point L in the plan. Transfer the distance L 2' 1' to the pat-

tern in Fig. 28, as shown on either side from L' to 1'. Draw lines from D to 1' and from 1' to the center A, from A to 1' and from 1' to B.

Set off the widths of the flanges 2, 1 and A of Fig. 27 upon the lines A D and A B extended upon either side of the pattern, Fig. 28, as shown. With A E and A F in Fig. 28 as radii, describe the arcs, as shown. Then will H, 1', B, C, K, E, D, 1', F, P be the pattern for the flaring strip shown in elevation from 2 to 3. For the pattern of the flaring strip shown in front elevation by 5 6, the same method is employed. Produce the line 5 6, Fig. 25, until it intersects the center line at F. Now with A, Fig. 29, as center, and F 5 of the front elevation as radius, describe the arc C B. Divide the arc Y', shown in the plan, Fig. 25, corresponding to the bend 5 in the front elevation, into an equal number of parts,

for the fillet shown by 3 4 5 in the front elevation, Fig. 25. There are two ways of obtaining the pattern when the head is made by hand. The first and long way is to trace off that part of the circle shown in plan by 0, 1, 20, 16, 8, 0 upon a piece of metal, and cut out with the shears and solder upon the outside circle a strip of metal as high as shown from 3 to 4 in front elevation. This method I would not advise, as there is too much waste of metal in cutting the circle. The better and stronger way is shown in Fig. 30. Upon any line, as A B, lay off the stretchout of the arc Y', Fig. 25, corresponding to the bends 3 and 4 in elevation, as shown by the small figures from 20 to 0. At right angles to A B, on either side, draw the lines B F and A E, upon which lay off the width of the fillet and its under side, 3 4 5, Fig. 27, as shown by 20 C E and O D F. Draw a line

and A. The pattern for the flare, 2 3 is shown in Fig. 28. Roll this pattern upon the blowhorn stake until it has the required curve indicated by the arc Y', Fig. 25. Now turn the two laps or flanges shown in the pattern, Fig. 28, in the turning machine to the required angle shown by 1 and A, Fig. 27. If the turning machine does not bring the flanges to their proper angles place them upon the bottom stake and with the use of the mallet bring them to their proper angles. The pattern shown in Fig. 29 is formed in the same manner as explained above. The laps on the pattern for rear of head, shown by the dotted lines in Fig. 26, can be bent to the required angle by means of the flat plier or upon the hatchet stake with the use of a mallet.

The pattern for the square fillet shown in Fig. 30 is bent upon the line C D. The bend can either be made in

Fig. 29.—Pattern for Flare Shown by 5 6 in the Elevation, Fig. 25.

Fig. 30.—Pattern for Fillet Shown in Elevation, Fig. 25, by 3 4 5.

Fig. 32.—Method of Placing a Pro file Inside of the Notched Fillets so as to Obtain a True Circle.

Fig. 31.—Pattern for Fillet Represented in Elevation, Fig. 25, by 6 7 8.

Fig. 33.—The Leader Head Ready to be Soldered Together.

CONDUCTOR HEADS.—PATTERNS FOR A CIRCULAR HEAD.

as shown from 0 to 16. Transfer these 16 divisions to the arc C B, Fig. 29, as shown. Draw a line from C to the center A, and from A to B. Now with A, Fig. 29, as center, and F 6 of the front elevation, Fig. 25, as radius, describe the arc 3' to 3'. From the point 16 in plan draw a line to the center M, as shown by the line 16 M, intersecting the circle O at L' of the plan. As the circle O is not intersected by the flat back, the distance from L' to 3' must be added to the inner circle of the pattern to make it complete. Divide this portion of the circle into any number of parts, shown by 0', 1', 2' and 3', and transfer these spaces upon the arc 3' 3' shown in pattern, Fig. 29, commencing on the line D A and A B at points 0' 0', as shown from 0' to 3' on either side. Draw a line from 3' to the center point A and from A to 3'. Allow the flanges, shown by B and C, Fig. 27, upon the pattern by D E and F G, in the same manner as explained in connection with Fig. 28. Then will D, C, 3', F, P, G, 3', B, E, K represent the pattern for the flare, shown in the front elevation, Fig. 25, from 5 to 6.

The next step is to obtain the pattern

from C to D and from E to F, extending the line E F in the direction of H and G. Referring to the plan, Fig. 25, the line 20 M intersects the arc Y', as shown at S. Then will the distance S 5' in plan represent the increased distance on the line 5 necessary to meet the flat back. Transfer the distance S 5' to each end of the line E F, Fig. 30, as shown at H and G. Draw the lines H C and G D. Then will A B G H represent the pattern for the square fillet shown in the front elevation, Fig. 25, by 3 4 5. This method gives no waste whatever, as the pattern is straight, the lower portion being notched, as shown in the pattern. The dots shown on the line C D, Fig. 30, indicate the bend 4 shown in elevation.

Fig. 31 shows the pattern for the square fillet 6 7 8 of Fig. 25. The same rule is followed as explained in connection with Fig. 30. This completes the entire set of patterns required for the circular leader head shown in Fig. 25.

Forming the Leader Head.

Referring to the section shown in Fig. 27, it will be seen that the top flare, 2 3, has two laps or flanges shown by 1

the folder, the cornice brake, or by means of the hatchet stake and mallet. The notches, indicated by I, J, K, &c., shown in the pattern, Fig. 30, are cut with the shears after the bend is made. A mistake often made by workmen is to first roll this pattern to its required circle, then notch with the shears and bend over with the flat pliers, thereby failing to obtain a sharp corner. The better plan is to make the bend first, then notch the flanges required, letting them overlap each other as the bending is done. For forming the pattern shown in Fig. 31 the same method is employed. In Fig. 32 is shown the method of placing a template inside of the notched fillets so as to obtain a true circle. As will be noticed by referring to the figure, A represents a template cut from an old piece of tin or other metal corresponding in shape to the circle required. B represents the notched fillets drawn around the circle A. Draw the fillet B, Fig. 32, tightly around the template A and solder the seam. After the seam is soldered the notches are flattened down well with a small hammer and all of the notches soldered, after which the old tin bottom A is slightly tapped with the hammer and will fall out. This

leaves the fillet completed, giving it stiffness and the shape being a true circle.

Soldering or Joining the Head.

In Fig. 33 is shown the leader head in separate parts ready for joining or soldering together. B represents the flat back shown by B in Fig. 26. As will be noticed by referring to Figs. 27 and 33, similar bends are indicated by similar figures. Therefore, the flare shown by 2 and 3 in Fig. 33 is the same as shown by 2 3 in Fig. 27, and is joined to the fillet 3 4 5, Fig. 27, corresponding to the fillet 4 in Fig. 33. Likewise the flare shown by 5 and 6, Fig. 33, corresponds to the flare shown in Fig. 27 by 5 and 6 or B and C. The flare 5 6 being joined to the fillets 3, 4, 5 and 6, 7 and 8, shown in Fig. 27, corresponding to the two fillets shown by 4 and 7 in Fig. 33. The tube 8 shown in Fig. 33 corresponds to T, Fig. 27, and is joined to the fillet 6, 7 and 8, Fig. 27, corresponding to the fillet 7, Fig. 33. Care should be taken to have all flanges placed on the inside of the head, as shown in Fig. 27, and solder water tight.

Berger Gutter Hangers.

The accompanying illustrations show some new gutter hangers which Berger Bros., 231 and 237 Arch street, Phila-

Berger Gutter Hangers —Fig. 1.—Hanger No. 28.

delphia, are putting on the market. These hangers are designed to allow of the hanging of a gutter to almost any kind of eave. Tinner have heretofore, it is claimed, had difficulty in providing a suitable hanger in cases where slates were laid, or where the eaves were narrow or had clapboard moldings on them, preventing the use of the ordinary hangers. The new hangers, it is stated, will save a tinner the valuable time often consumed in making an examination of a building for the purpose of determining upon a method for

Fig. 2.—Hanger No. 27.

fastening gutters to eaves, owners not always being able to describe the finish of the eaves or select a suitable hanger and frequently objecting to the suspension of the gutter from the shingles. As will be seen, a tinner having a small assortment of these hangers can hang a

gutter to almost any kind of eave. In the case of an exposed rafter, hanger No. 28, shown in Fig. 1, is used, being simply nailed to its side. In a case where there is no rafter or cornice, hanger No. 27, Fig. 2, will slip up under the shingles. Where a roof is already slated and finished with mold-

Fig. 3.—Hanger No. 30.

ings of various shapes, whether steep pitch or not, large or small, hanger No. 30, shown in Fig. 3, will suit. It is nailed at the top and bottom, and the lower brace can be bent when a better footing is desired. For metal roofs and awnings hanger No. 34, shown in Fig. 4, is especially suited. It is to be clamped under the sheets and requires only one bolt through the top. Not being exposed it is not subject to corrosion. The gutter can be hung close to a metal roof, at any pitch desired, and may be easily, quickly and strongly affixed. A leading feature in the construction of these hangers is the hinge, which allows of their adjustment to any angle or pitch. The hinge allows the stem to which the circle is fastened to hang plumb without regard to the angle at which the upper plate is nailed. The stem hangs close up to the moldings and the circle fits close to the roof, which is said to be an advantage when taken in connection with various

Fig. 4.—Hanger No. 34.

pitches of roofs, short projections of shingles or slates, or in the case of a long fall in a gutter.

Messrs. Berger Bros. are also introducing a new circle which they call the Royal. The circle differs from the other circles made by them in that it has a sliding bead hook instead of a strap, which is quickly wired down, forcing the gutter to spread back and down tight to the circle. The hook also allows for variations in the size of the gutters. Another feature in the circle is the improved inner stop hook and the ornamental bead underneath. The circle is designed for use with any of the shanks manufactured by the firm.

FLASHINGS.

RUDOLPH & LEWIS, 43 Michigan street, Cleveland, Ohio, have contracts for the copper work, slate roofing and skylights on the First Presbyterian Church at Warren, Pa., also for the galvanized iron, tin, slate roofing and skylights on the Glenwood M. E.

Church, Buffalo, N. Y., and the galvanized ventilating pipe for the United States Post Office and Custom House Building, Jacksonville, Fla.

THE GRISWOLD, RICHMOND & GLOCK COMPANY, Meriden, Conn., have taken the contract to build a large galvanized iron cornice for the new Nihilist Block in New Britain.

MACHWIRTH BROTHERS COMPANY, 92 Broadway, Buffalo, N. Y., send out a pretty little pamphlet of 16 pages calling attention to some of their specialties. Skylights take up half of the book, then come ridging, gutters, cornices, finials, ceilings and chimney tops. The pamphlet measures 4½ x 5½ inches, and within this small compass contains much interesting matter to the roofing trade.

THE POORMAN MFG. COMPANY issue a notice under date of May 20 that they have moved their manufacturing plant from Canton, Ohio, to Piqua, Ohio, where they have new and better constructed works especially adapted to the requirements of the business, and which will be equipped to furnish complete lines of sheet metal working machinery. They allude particularly in the announcement of their removal to their corrugated conductor pipe machines, ridge roll machinery, eave trough forming and heading machines and several other special machines and tools.

THE CATALOGUE just at hand from the American Roofing Company of St. Louis and Cincinnati is a pamphlet of 50 pages, bound in firecracker paper and carrying the name of the concern in raised black letters. In an introductory note to the trade they mention that their factories at Cincinnati and St. Louis are so situated that they have excellent shipping facilities both by rail and river. They also allude to the complete equipment of their plants. The first goods noted are corrugated sheets, which are made from either black, painted or galvanized iron. These are illustrated and described and their application to different purposes shown. V-crimped roofing comes next; then pressed standing seam roofing of different sorts, roll and cap roofing, while later on attention is given to sheet steel pressed brick, weather boarding and metallic lathing. Sheet iron and steel ceilings are described and directions are given for applying these materials. Galvanized gutters, eave troughs and spouting are shown. A page is given up to their Obelisk metallic paint and cement. Toward the end of the pamphlet are printed the rules of measurement as adopted by the Iron Roofing Association; also the rules adopted by the association to govern all contracts for roofing, siding, &c. A telegraphic code and index complete the pamphlet.

THE FOLLOWING item of interest is taken from a recent issue of the Chicago Economist: "James A. Miller has sold to John H. Whittemore of Naugatuck, Conn., the ground at 129 to 129 South Clinton street, 118 x 100 feet to an alley, for \$100,000. This is one of the best recent transactions in Chicago real estate. The property is east front, between Monroe and Adams streets. Mr. Miller will take back a lease of the ground for 99 years, at a yearly rental of \$5000. On the basis of this transaction the front foot valuation is a trifle less than \$847, and the square foot valuation \$8.47. Mr. Miller is about completing a fine building on the property. It is six stories high and occupies the south 80 feet of the tract. It is constructed of pressed brick and stone, and was designed by John H. Wagner. When it is completed Mr. Miller will occupy a part of the building with his business. The

north 38 feet of the ground is covered by a five-story building devoted to manufacturing, and is occupied by James A. Miller & Bro., but it is the present intention to remove this building and construct on the same site a ten-story structure to conform in general appearance to the building now being completed. This building is constructed with a view to adding two stories, making the block ten stories high, at an approximate cost of \$115,000, being an excellent security for the ground rent. As is well known, Messrs. Miller are the largest roofers and cornice manufacturers in the West."

THE NEW PLANT of the Saltsburg Rolling Mill Company, at Saltsburg, Pa., under erection for some months, is almost completed. The plant contains one pile and one combination furnace, three sheet furnaces, three pair furnaces, four annealing, a 22 inch bar train and sheet train, and two pairs sheet shears. The buildings consist of a main building 110 x 180 feet, warehouse and annealing department 60 x 132 feet, boiler house 32 x 60 feet, and the foundations are almost complete for a picking house 30 x 60 feet. The new concern will manufacture iron and steel sheets and rustless roofing steel. The officers are as follows: S. A. Gourley, president; W. T. Stitt, treasurer; D. U. Remaley, secretary, and Gill Stitt, superintendent.

English and American Labor Contrasted.

In the course of an editorial the *Iron and Coal Trades Review* makes the following somewhat bitter comments:

The English workman is usually conservative in his ideas, and he is slow to accommodate himself to such altered conditions as are imposed by the remarkable growth of manufacturing industries in other countries. He will not relax his trade union regulations as to the number of machines that the average worker may tend, as to the terms upon which overtime may be worked, or as to many other matters that handicap English industry, because, being ignorant of the conditions that have been established abroad, he does not recognize the necessity of modifying his system. The English mechanic or other skilled operative starts with a prejudice against innovation and rather hinders than assists anything like progress in processes and appliances. If the English manufacturer cheapens the cost of production, he gets no aid from his men. He is lucky indeed if he does not find them disposed to wreck his plans and prevent a more excellent order from being established, since the demoniac spirit that incited to Broadheadism and Luddism is not yet entirely exercised. But with the American workman it is entirely different. Many of the best and most useful of the numerous inventions that are of American origin have been due to workmen. Employers are only too ready to give facilities and rewards to inventive talent, whether in their own employment or otherwise, and for this reason American workmen are often found ready to aid employers in this direction, while they seldom refuse to give to every system designed to economize or to lighten labor the fullest possible chance.

With this essential difference in favor of American and against English industry it is little wonder that American manufacturers are making more headway than our own. A notable case in point has just been brought to our

notice. Two works are established—the one in Leeds and the other in Chicago—for the manufacture of wagon frames by a well known system. As both works are virtually controlled by the same management they present all the essential elements of a fair and equitable comparison. The works in Chicago pay just about double the wages that are paid in Leeds, and yet, such is the energy and vigor which the men in Chicago throw into their work, and such the facilities which they give for turning work out rapidly, that the products of manufacture are—or at any rate can be—sold more cheaply in Chicago than in the heart of the most active industrial community in England. Facts of this kind, however, are by no means so generally known—and especially not to the workmen themselves—as they should be. If, as a result of the superiority of the American methods, the Chicago works should take all the orders worth having from Leeds—which they would, of course, be more likely to do were they not nearly 1000 miles from the seaboard—the Leeds workmen could hardly be blamed if they were kept in ignorance by their employers of such paramount facts. It is therefore of great importance that steps should be taken to give the workmen the chance of seeing for themselves how England is losing ground by rigid and foolish adherence to our old and untenable ideas. But, as the workmen do not appear to care to trouble themselves about these matters, the difficulty is to find out how to imbue them with this knowledge. It would be much better for the country and for themselves if the workmen were to spend a tithe of the money they waste over fruitless and disastrous strikes on ascertaining "how the world wags" in outside markets. But they have still to be educated up to the recognition of this important branch of knowledge, and it is only to be hoped that the awakening may not come too late.

Another Trades School.

Some of the leading builders of New Bedford, Mass., says *Carpentry and Building*, are moving in the matter of establishing trade training in the public schools of that city. It is stated that failing to have instruction in the trades included in the regular school course, the builders contemplate the founding of a trades school supported by private enterprise. This subject is worthy the most careful consideration by both employers and workmen, and each should be equally interested in the careful and thorough instruction of apprentices. The old system of apprenticeship under which the boy was taken into the master's family and carefully taught the principles of a trade is practically a thing of the past, and some system must be adopted to fill the space left by its departure. The apprentice in the building trades to-day is simply an errand boy, who in the course of his day's work is expected to pick up sufficient knowledge to some time enable him to become a journeyman. That such lack of system as this is bad is most evident and is in itself a demand for something better. In the present state of affairs both employers and workmen have cause for complaint; the former objecting to the restriction by the unions of the number of apprentices, and the latter objecting to the substitution for journeymen of apprentices at less wages. There are other

causes of complaint on both sides, but these are sufficient to show the need of a concerted effort by both to bring about a better condition of affairs. The form of training which obtains in the trades schools of New York City and Philadelphia is regarded as offering the best solution of the question thus far established, and the New Bedford builders add another city to the steadily increasing number in which the vital need of some settlement of the apprenticeship question is recognized.

In connection with the above it is interesting to note that the Master Carpenters' Association of Bridgeport, Conn., recently appointed a committee to inspect and report upon the educational work and especially the manual training carried on at the Young Men's Christian Association in that place. In their report the committee highly commend the work done, and state that it is divided into five departments, namely: Industrial and Fine Arts, Science, Business, Language and Music. In the first named are two classes in mechanical drawing, one in machine designing, one in freehand drawing and one in elementary carpentry. In examining the work in carpentry the committee report that the association makes no claim to graduate carpenters, but to improve men in the trade and to give practical help to others who may desire. The method of instruction involves the use of 18 benches with as many sets of tools and a blackboard and plates for the purpose of illustration. The course of study pursued includes the use and care of saws, planes, chisels and laying out tools, followed by joint work and construction in framing and paneling. Attention is also given to filing and setting saws and sharpening tools. Upon receipt of the report of the committee the Carpenters' Association adopted a series of resolutions in which they heartily indorsed the work and commended it to the support of the public and to such as might wish to avail themselves of its privileges. They also pledged to the Young Men's Christian Association their cordial co-operation and aid, particularly in this department of their work.

The Bethlehem Iron Company, Bethlehem, Pa., shipped last week a ballistic plate weighing 24½ tons to St. Petersburg, Russia, for the new Russian war vessel "Petropaulowski." It is a test plate, and upon its arrival at its destination it will undergo a thorough trial at the hands of the Russian ordnance authorities. This constitutes the first shipment on the armor plate contract placed by Russia in this country. It is, moreover, the first specimen of armor plate ever produced here for a foreign government.

The special agents of the Department of Labor at Washington have begun work upon the investigation recently authorized by Congress in regard to the effects of machinery on labor, the results of which promise to yield some valuable information if the investigation can be worked out with sufficient thoroughness to afford accurate comparisons.

An unfinished tunnel, started at Tower City, Pa., some 40 years ago, is to be completed by the Reading Railroad Company, who will drive it through the mountain to Rausch Gap, opening up a rich tract of coal land.

TIN PLATES.

The Welsh Tin Plate Workers' Union.

Things do not look any more promising for the Welsh tin plate trade than they did at the opening of the year. Many of the agreements under which the workmen employed in the various works in South Wales accepted a reduction of 12½ per cent. in their wages, with the consent of their union, ended on the last day of May. Others have extended their agreements to the close of June. It is understood that a number of the workers have decided to demand further concessions on the termination of these agreements. This fact has stirred up among the workmen the desire to bring all the works to a standstill at the end of June, and only to restart after securing what they consider fair terms.

With the view of discussing this situation the Executive of the Tin Plate Workers' Union met in special session the week before last at Llanelly and decided to issue a manifesto to the trade, and at the same time to make every preparation necessary to carry out a general strike if that course was finally decided on. This will be determined at a special meeting to be held to-day. As expressing the sentiments of the Welsh workmen in the present crisis, the manifesto promulgated by the Executive Committee of the Tin Platers' Union is interesting. Addressed to "The tin plate workers of South Wales, Monmouthshire and Gloucestershire," it reads as follows:

Our present position as tin plate workers is surrounded with difficulties. As the Executives of your union we feel it a duty to use the power you have placed in our hands to insure our best interests. At the close of last year the granting reductions of wages and apathy of tin platers at work brought forth instruction by the Cardiff Council that no body of men should accept a greater reduction than 10 per cent. It is known that the average earnings over ten years of the highest paid mill men working under fair conditions amounts to £2 (£10) per week: a 10 per cent. reduction brings wages, therefore, below a fair living wage. Employers made this reduction general. Then was witnessed a further demand of 2½ per cent. This again has been widely enforced, and no sooner is that likely to become general than further demands of 15, 22½ and 25 per cent. are made, and we foresee that if you remain passive these reductions will become general, to our own loss and that of business men dependent upon us. The last six months enables all to test the effect of reductions upon the tin plate trade, with the result that our contention that wage reduction is no remedy has upon the best authority been practically demonstrated to be correct. Our employers have made our lot harder without in any way making their own better.

Not a box of plates less would have been sold if 3 pence per box, representing the 12½ per cent. reduction, had been paid. On the other hand, the reduction of wages in Wales helped American makers to get a much higher proportionate reduction from their men, to our injury. The cutting into the living wage has also caused our best workmen to place their skill at the disposal of American competitors, to the loss of the Welsh trade.

To defend the general interests, we appealed to our employers to loyally join a Board of Control, with the object of regulating make and wages. This, as a body, they refused to do, but charged those employers who did with seeking the opportunity to profitably dispose of stocks and of promoting their American interests. In spite of all this, the loyalty of tin plate workers to the Board of Control has been marvellous. Workmen made sacrifices to secure for themselves living wages, while employers refused co-operation to secure fair prices. The natural sequence is that whatever employers may do, workmen will go steadily onward to secure and defend a living wage. Your Executive have come to the conclusion: 1. That the best interests of employer and employees in the tin plate trade demands that an end be brought to the gambling in wages now going on. 2. That a uniform wage rate be re-established. 3. That the 1874 list gives to tin plate workers only a living wage. 4. That a special council of the whole trade shall be held on June 1 to decide whether tin platers will at the beginning of July agree to work at anything under the 1874 list.

Thus it will be seen that further trouble seems to be in store for the Welsh tin plate manufacturers, provided the majority of the workmen support the views expressed by their union officers in the foregoing manifesto. It is understood, however, that at some of the works a reduction of wages below the 12½ per cent. rate has already been accepted by the men, or what is equivalent to the same thing, concession of a larger make on the day's work than the 36 boxes laid down by the union.

Immigration of Welsh Tin Platers.

It will be of interest to our readers to know that the supply of skilled labor at the disposal of American tin plate works is being rapidly reinforced by immigration from the other side of the water. For some weeks past, advices from England have recorded the fact that a steady stream of workmen from the Welsh tin plate districts has been pouring over to this country. Discouraged by the unsatisfactory state of affairs in the tin plate industry in Wales, and despairing of any substantial improvement in its condition, many of the Welsh workmen have severed their connections with the old country, and have set out to seek what they believe to be a fairer field of employment among the new works which are springing up in the United States. A significant feature of this movement is that the men who are leaving Wales

for this country belong largely to the class of steady and skilled workmen. At least, they are thus described by the local papers, which deplore their departure as a severe loss to the home industry. Moreover, the bulk of the recent immigrants do not come from the ranks of the unemployed, but are men who, up to the time of their departure, were earning steady wages at some of the active works in Wales. The *Industrial World* of Swansea, which is the organ of the Welsh Tin Platers' Union, appears to be at a loss to account for the increasing number of men now leaving the country. Commenting on the subject, it says:

"One of the saddest sights in South Wales, but one, alas, too often witnessed, is the departure of sturdy, sober, and industrious tin platers, who leave the country where they fail to get employment, or what they consider fair conditions of labor. Scarcely a week passes without a group of friends being seen at various stations bidding good-bye to men who leave Wales to seek a better home in America. Every week we have reports of farewell meetings, and it will be noted from the speeches delivered thereat that it is not the ne'er-do-wells that leave us, but the very cream of the tin plate industry. This means that America becomes possessed of our best skilled workmen, and it is these men's skill as much as anything that will take from Wales its monopoly of the tin plate trade. Knowing the men who leave our shores, and the thousands of unemployed that are to be found at every tin plate center, what strikes one most is the fact that it is not the unemployed who make up the majority that leave. Last week roller-men left Morriston and Swansea, but they were from Cwmbrwrl, Worcester, and Forest Works, neither of which could be said to be hopelessly idle. Why is this? It appears to an onlooker as if there is some unseen influence at work inducing the very best men to leave Wales. American labor leaders look with disfavor at this flooding of their country with tin plate workmen. The *Labor Tribune*, the official organ of the Amalgamated Association of Iron and Steel Workers, has given a timely warning that labor is too plentiful at tin plate works. Notwithstanding this there appears just now a mad rush for the American shores. It cannot be believed that Welsh skilled workmen will break up their homes and separate themselves from their friends and give up present employment on the mere chance of getting employment in a strange country. We must acknowledge that this is a mystery. Letters are sent to friends in Wales that give no encouragement to any one to leave the country, others show that some millmen are doing fairly well, but this does not supply the explanation."

Little notice seems to have been taken of the arrival of these men here. Yet, by all accounts, the number who have landed on these shores during the past month or six weeks must have been considerable. How far their expectations of securing steady and remunerative employment in this country will be realized we cannot forecast. It is likely that they may succeed in finding early employment among the large number of newly es-

established tin plate works, which will need skilled help at their outset. But whether they will retain their berths permanently will depend, not on their skill alone, but more on their adaptability to American conditions. In the early days of American tin plate manufacture the employment of Welshmen in the pioneer works did not prove an unqualified success. While thoroughly efficient at their trade, they in many instances proved so intractable and self opinioned, and evinced such a tendency to agitation, that by degrees they were replaced by Americans. Some of the largest tin plate plants now operating in this country are, as a consequence, run entirely by native labor, and in the four years which have elapsed since the beginning of the tin plate manufacturing industry in this country, a very large number of American youths have been initiated into the so-called mysteries connected with the trade, and have proved themselves remarkably skillful. If we may judge by the quality of the work now put out from some of the largest plants where only native labor is employed.

The Town of Vandergrift.

The Apollo Iron and Steel Company, Pittsburgh, Pa., have commenced preliminary work on what will undoubtedly be the finest model town in the United States. The new town will be known as "Vandergrift," and an immense sum of money will be spent on it. The firm have a farm of 640 acres just below Apollo, Pa., the site of their present plant, on the opposite bank of the Kiskiminetus River. On the flat by the river a new works will be erected, a contract having already been given to the Shiffler Bridge Company, Pittsburgh, Pa., for an iron building 600 feet long, 140 feet wide and 34 feet in the square. This building will contain a blooming mill of modern type, an improved bar mill and eight finishing sheet mills. The new town will be located on the slope of a hill overlooking a beautiful valley. Frederick Law Olmstead is now engaged in laying out the ground. Mr. Olmstead is of the firm of Olmstead, Olmstead & Elliott, landscape architects, Boston, who designed the World's Fair grounds. It is the intention of the creators of the new city to thoroughly drain it, lay brick and asphaltum pavements, with flag sidewalks, run natural gas pipes through every street, with connections for every lot and have spring water piped through the streets before one lot is placed on the market. The town will be lighted with electricity, the company now supplying it to Apollo, and the natural gas wells owned by the company will be drawn upon to supply the inhabitants of the new town. The land is underlaid with a good quality of coal, which will be mined if a gas shortage occurs. All the streets will be broad and the sidewalks will be bordered on either side with grass plots. The main street will contain the stores, which will be built of sandstone taken from a quarry of the company. A bank, capitalized at \$100,000, will be established as soon as the town is completed. The company will not have a store. The only condition placed upon the inhabitants is the prohibition of saloons. The land on which the new plant and the town of Vandergrift will be located was acquired for a twofold purpose—first, to give the firm room for the building of the new works, and second, to establish a town in which their employees could purchase homes at a moderate cost and at the same time enjoy all the conveniences to be found in the city, and many, or all, of the luxuries of the country. The sur-

vey work has been completed and architects will begin at once on the preparation of the plans for the town. It is the intention of the firm to gradually remove their entire manufacturing interests from Apollo to Vandergrift. When the new mills at Vandergrift have been completed the work of removal from Apollo will begin. For a time operations will be carried on at both Apollo and Vandergrift, but as speedily as possible everything will be removed to Vandergrift. When present plans now under way have been completed the Apollo Iron & Steel Company will have a capacity for turning out 200 tons galvanized and smooth finished iron and steel sheets every 24 hours.

SCRAP.

THE LICKING ROLLING MILL COMPANY, Covington, Ky., have placed an order with the Leechburg Foundry & Machine Company, Pittsburgh, Pa., for the tin plate machinery which they are introducing into their mill.

DURING the recent strike at the works of the Illinois Steel Company of Joliet, Ill., the Irondale Steel & Tin Plate Company's works, at Middletown, Ind., were forced to close for a short time on account of their inability to secure steel billets from Joliet. They resumed operations this week.

THE NEW PLANT of the National Tin Plate Works, at North Anderson, Ind., is being rapidly pushed to completion. The announcement is made that the works will be ready to start by July 1.

THE *Engineer*, of London, is now publishing a series of interesting articles by an American correspondent, treating in an exhaustive manner of the growth, progress and present condition of the tin plate manufacturing industry in this country.

THE STAR TIN PLATE COMPANY, Pittsburgh, Pa., have given an order to the Leechburg Foundry & Machine Company of that city for two Mesta patent pickling machines. These machines, with the improvements recently effected by the addition of an automatic power turning attachment, have proved highly efficient. The new attachment is said to save much time and labor, as by its use the crates of plates are automatically swung from one pickling vat to the other without the use of hand power.

THE Connellsville *Courier* states that a tin plate works, to employ 400 men, will shortly be erected at Connellsville, Pa., under the direction of George J. Humbert of Norristown, Pa., who is interested in a works of this kind which, it is understood, he is seeking to remove to a more favorable location nearer the base of coal supply and with better facilities in the way of water and railroad transportation. These conditions are met at Connellsville, and the citizens have offered liberal inducements to Mr. Humbert, which he is understood to have accepted.

THE MORTON TIN PLATE COMPANY, Cambridge, Ohio, are about to erect an addition to their works 120 feet long by 40 feet wide.

THE whole of the workmen at the Cynon Tin Plate Works, Aberdare, South Wales, struck last week, on the manager demanding an increased output over the 36-box rate. The works have been running on an average only one month in three during the past two years.

ABOUT TWO YEARS AGO a number of Welsh tin plate workmen were engaged for a new tin plate works at Basse Indre, near Nantes, France. A Welshman was appointed manager

of the works and the conditions of labor and pay were fixed at practically the same level as those prevailing in Wales. After a time, however, some Frenchmen, who had been given some insight into the trade by the Welshmen, offered to produce a large make at a lower scale of wages. These terms were offered to the Welshmen, who refused and were discharged, while the native workmen were put in their places. It appears now that the Frenchmen were unable to satisfactorily operate the works, and the result has been that the Welshmen have been re-engaged on a five years' contract on the terms prevailing in Wales.

W. E. JONES, late of the Dyffryn Tin Plate Works, Swansea, Wales, has been appointed sales agent for the Phillips Tin Plate Company of Philadelphia. Mr. Jones, whose address is 918 Filbert street, Philadelphia, will take care of the trade in that city and the nearby district.

THE NEW TIN PLATE PLANT of the La Belle Iron Works, Wheeling, W. Va., is almost completed and will probably commence operations within a week or ten days. It is expected to make a test of the machinery some time during this week.

THE OHIO RIVER SHEET & TIN PLATE COMPANY of Pittsburgh, Pa., have been granted a charter to incorporate, the capital stock being \$50,000. The new company will erect a tin plate plant at Rochester, Pa.

THE FILLEY TIN PLATE COMPANY, Norristown and Philadelphia, Pa., have added to their line of terne plates a new brand termed "Filley's Old Style," which they place on the market as a high grade roofing plate.

According to statistics gathered by a prominent firm of cotton brokers in New York City, based on replies to questions received from 2141 planters, cotton merchants, banks and bankers, the cotton acreage of the United States this year amounts to 17,558,000 acres, as compared with 20,309,000 acres in 1894. The decrease thus shown amounts to 2,751,000 acres, or 13½ per cent.

The report of the Bureau of Animal Industry, at Washington, for the fiscal year 1894, shows that during the year more than 13,000,000 head of animals were inspected by their agents, in 17 cities. Of this number a total of 16,705 were condemned. The total number of beef cattle inspected last year amounted to 3,862,000, or nearly one-half the cattle placed on the market. The bureau has been doing specially good work in preventing the export of diseased cattle and of hogs infected with trichina.

Secretary of Agriculture Morton has formulated a new plan, by which he expects to obtain absolutely accurate figures of the yield of cereals in the United States. He suggests that the various States issue licenses to all threshers of grain and shellers of corn, at a nominal sum, requiring them under oath to return the number of bushels of grain threshed and corn shelled. In order that this plan shall become operative, however, the co-operation of all the State legislatures will be necessary.

The Knights of Labor have selected a site at Washington for their permanent headquarters. Ground was broken on Monday for the new building.

PLUMBING and GAS FITTING.

Noisy Faucets.

The following is the result of an interview between a Utica, N. Y., newspaper reporter and a local plumber:

"Sometimes," said the plumber, "in places like Utica where the water pressure is heavy, one of the faucets gets in the habit of roaring. You open it at full head and you hear no unusual noise, but you open it part way and you are immediately surprised by a jarring and vibration of the pipes and a roaring is heard all over the house not unlike a Silsby engine. The lady of the house gets frightened, the hired girl thinks that something is going to burst and when the householder comes home he is at once informed that the plumbing is out of order. He looks at the pipes very carefully, as though he could see right through them, then he feels of them carefully and with a knowing air remarks that they look all right. Then he tries the faucet, carefully, of course, and when it begins to roar he looks frightened, shuts it off suddenly and concludes that something is out of order. He consults a neighbor and learns that 'plumbers do not more than half do their work of late years,' and the opinion is expressed that it will cost a nice little sum to have things fixed up as they ought to be.

"The lady of the house, her husband and the hired girl are careful for two or three days every time the particular faucet is opened, and finally the sense of impending danger and the continuance of the roaring become unendurable and the householder hunts up the plumber and tells him all about the trouble. The plumber smiles and advises the householder to turn off the water in the cellar, get a wrench and put a piece of new packing in the faucet. This done, and there is no more trouble. The roaring is caused by the vibration of the packing which has become worn or loosened. It is no fault of the plumbing, not caused by extra pressure and not caused by air in the pipes."

TRAPS AND VENTS.

GERRY & BROWN of Taunton are fitting up a store in Ackerman's Block, Montello, Mass., for a plumber's shop.

THE BOARD OF HEALTH OF KINGS-TON, N. Y., is looking sharply after defective plumbing and careless plumbers in that city.

THOMAS BURNS has started in the plumbing business in Norwich, Conn.

WM. HOLBROOKS & BRO. have opened a plumbing, gas and steam fitting shop at Athens, Ga.

STAI & HEIMAN, plumbers and gas fitters, have opened a shop at Gallipolis, Ohio.

THE MASTER PLUMBERS of St. John, N. B., at a meeting held last week, elected the following officers: Thomas Campbell, St. John, president; John Borton, Halifax, first vice president;

James H. Doody, St. John, second vice-president; P. Campbell, St. John, secretary and treasurer.

J. J. MCGUIRE, who was examined on his application for a plumbers' license, at Worcester, Mass., passed successfully and has been duly licensed.

THE UNION BRASS & METAL MFG. COMPANY, St. Paul, Minn., are issuing a catalogue and price-list of their Hercules seamless copper ball floats, which are made in all sizes from 4 to 16 inches in diameter. They also make floats all sizes, weights and shapes to order to stand any desired pressure. The floats are manufactured by a patent process which enables the production of hollow copper ware without seams and of a quality which is said to be superior to hard rolled metal. These floats are specially designed for use in steam traps, receivers and apparatus under high pressure.

BUSINESS at the hollow ware works of Dawes & Myler, New Brighton, Pa., is booming at the present time. The number of men now employed is larger than ever. About 100 bathtubs are being turned out daily and the demand for them is increasing. The potteries and sewer pipe works are also working steadily with a full force of employees.

THE APPLICANTS for a journeyman plumbers' license at Waltham, Mass., are given a practical test as well as a theoretical examination. Several young plumbers who believe they have spent all the time that is beneficial as apprentices have applied for examination.

R. H. PAINE, Brainerd, Minn., will move his plumbing establishment from Main street to Sixth street south.

THE STAR COUPLER COMPANY, St. Louis, Mo., at a meeting of the stockholders held last week, decided to increase their capital stock from \$30,000 to \$40,000. The assets of the company were shown to be \$30,000 and their liabilities \$950.

In *The Metal Worker* of May 25 we mentioned that C. T. Lamson had secured the services of T. Frank Clark and was going into the plumbing, steam, hot water and gas fitting business, and stated that he requested manufacturers and dealers to furnish him circulars and price-lists relative to goods for the steam, hot water and gas fitting trade. We erroneously stated, however, that Mr. Lamson is located at Elizabethtown, N. J., his correct address being Elizabethtown, N. Y.

F. HANSON, Rome, Ga., has opened a plumbing establishment on Broad street, and has purchased the entire stock of W. B. Campbell & Co., plumbers. He is now prepared to do plumbing, steam fitting and gas fitting, and in addition to this will open a general tinning business, having with him R. W. Roebuck.

O. W. WEYBRECHT, the West Palmer Beach, Fla., plumber, is visiting Bay Biscayne section. Mr. Weybrecht will erect some of the sormotor irrigating machines on some of the fine farms in that section.

THE VANDERMAN PLUMBING & HEATING COMPANY, Willimantic, Conn., are issuing a new pocket edition of their Plumbers' Estimate and List Book, 4 x 7 in size and bound in a cloth cover. The first 12 pages are filled with a price-list of the standard goods required in a plumbing system, including iron and lead pipe, brass goods, boilers, sanitary earthenware, and a list of their patent labor saving specialties. The list is so prepared that space is left for marking in the discounts on the different goods. Two pages are required to include the different fittings which may be required in a plumbing contract. Room is left for adding the name of the customer for whom the estimate is made and the date when the price is quoted. The estimate gives a comparatively complete list of all the different fixtures and supplies that may be needed, and there is space left for adding in the quantity of the material to be used. This will aid the plumber in avoiding the omission in the estimate of any material that would be required in the job. This book should be found a great convenience to the plumber.

THE JAMES A. STIDGER PLUMBING COMPANY, at St. Louis, Mo., have filed articles of incorporation.

L. WOLFF MFG. COMPANY, 93 West Lake street, Chicago, have just issued a very pretty copyrighted catalogue descriptive of their cross bar stops and wastes. The catalogue comprises 38 pages of illustrated matter, showing each style of stop, with figure number, sizes and telegraphic code word so as to avoid mistakes in ordering and consequent delays in shipment. Wolff's cross bar stop and waste is of a distinctive type. All styles have double checks and are reversible. By reversing the position of the handle and check plate and turning the plug, they are easily changed from left to right, and vice versa. All handles are interchangeable. Socket, lever handle, tee handle or gas pipe connection can be used. Any one of these can be furnished separately to keep in stock for changing. Further, the cross bars, in which additional metal is cast in ridges crossing the front center at right angles, give much greater strength than metal of one thickness. The double check is also conducive to increased durability. The illustrations are of a character to fully bring out all these points. The pamphlet is gorgeously covered in heavy maroon colored paper with lettering embossed in gold.

The following plumbing firms have recently started business in Chicago: McCorey & Clifford, 1317 Van Buren street; William Watts, 1748 North Halsted street; John E. MacDonald, 348 Robey street; Kenny & McDonald, 247 Wells street; Thomas Wickens, 2365 North Paulina street; James A. O'Neill, 3133 Cottage Grove avenue; O'Shea Bros., 1955 North Halsted street.

THE GILBERT & BARKER MFG. COMPANY, 82 John street, New York, are issuing a circular that should interest the plumber at this season in reference to their new automatic instantaneous

water heater. It is designed to take the place of a boiler and water back yet supply hot water at any hot water faucet in the system. It only burns gas when the water is being drawn, and contains no quantity of heated water to make the kitchen uncomfortable in summer.

B. F. HOOPER of the Colwell Lead Company, 63 and 65 Centre street, New York, who has been traveling abroad for the past two months, is expected to arrive home on the steamer "Umbria" to-day.

CLEVELAND & LENNOX have established a shop in the old wire mill building opposite the railroad depot at Hamilton, N. Y., and are prepared to do sanitary plumbing. They are also dealers in iron and lead pipes, well and cistern pumps.

SECRETARY FRANK L. BEYER of the Master Plumbers' Association of Buffalo, N. Y., reports the election of the following delegates to the Convention of the National Association of Master Plumbers, to be held in Philadelphia June 11, 12 and 13: President J. S. Stygall, Jr., Chas. Geiger, Wm. H. Martin, F. H. Yuhl, J. L. Mensch, C. Brenner, H. J. Knepper; with the following as alternates: A. E. Stevenson, Jno. Germain, Dean Wilson, T. J. Kavany, F. C. Kampath, Chas. A. Smith.

AN ORDINANCE amending the plumbing ordinance of Cambridge, Mass., by striking out the last section, which provided that every drain pipe below a cellar floor be laid with a concrete base, has been passed by the Council.

W. H. SMITH, Calumet, Mich., is building a plumbing shop on Kearsarge street.

NEW JERSEY PLUMBERS, whether belonging to an association or not, are invited to meet with the New Jersey delegates to the convention of the National Association of Master Plumbers on Wednesday, June 12, at Philadelphia, for the purpose of forming a State association. Notice of the place of meeting will be given by the president of the convention on its assembly on Wednesday morning. Plumbers from Atlantic City, Trenton, Camden and the smaller towns are requested to be present. State Vice-President John Hickman of Paterson will be assisted in effecting an organization by the Hon. J. F. Blackshaw of Jersey City, Elias Berla, president of the Newark association, and Alexander Don.

ARTICLES OF INCORPORATION have been filed by the Ascher Heating and Plumbing Company, Des Moines, Iowa. The incorporators are Will Scoville and O. K. Ascher, who also constitute the board of directors. The capital stock is \$25,000. Mr. Ascher is president and Mr. Scoville secretary, treasurer and manager.

THE SHOP of E. C. Doane, Marblehead, Mass., has been undergoing some effective improvements, chief of which is the addition of a new and larger office. Hereafter the place will be lighted by electricity.

HENRY M. BIRKETT and ALEXANDER PALLAS have been appointed plumbing inspectors in Brooklyn, N. Y., at a salary of \$1200 per annum, the appointment to take effect June 1, 1895.

FRANK J. DEARBORN and FREDERICK W. HERRICK, both of Salem, Mass., have formed a partnership in the plumbing business under the name of Herrick & Dearborn.

Vest Pocket Pipe Wrench.

In Fig. 1 of the accompanying cuts is shown a vest pocket pipe wrench, offered by Chas. F. Mann & Co., St. Johnsbury, Vt. The wrench is made of cast steel, hand forged, with teeth cut in a lathe, the device weighing 1 ounce. It is designed for use in con-

Fig. 1.—Vest Pocket Pipe Wrench.

nection with any screw wrench in turning pipe, rods or any round or tapering plumber. The point is made that a plumber, steam fitter, machinist, engineer, &c., by having one of these wrenches in his pocket, will often be

Fig. 2.—Pipe Attachment Applied to Wrench.

able to find a screw wrench to use it in connection with, as in Fig. 2, when it might be difficult to secure a pipe wrench. The manufacturers claim that the device will not slip or stick on pipe; that it will not dent pipe; that it will not break; that it will hold hardened steel as well as soft iron, and that it will hold $\frac{1}{4}$ inch wire or a 3 inch pipe. The wrenches are mounted 12 on a neat heavy card.

The Atlanta Exposition.

The Cotton States and International Exposition, which is to be opened to the public at Atlanta, Ga., from the middle of September next to the close of the year, gives promise of being one of the notable exhibitions held in this country. Its promoters already claim that it will be excelled only by the Centennial Exhibition at Philadelphia in 1876 and the World's Columbian Exposition at Chicago in 1893, and a visit to the work now in progress recalls features of each of these great shows.

The ground occupied by the buildings approaching completion, and to be embellished with others, is like the area of Fairmount Park devoted to the Centennial Exhibition. It is rolling ground, with a fair proportion of timber. The names given to various buildings and their disposition about artificial lakes recalls the arrangement at Jackson Park, Chicago. The energy exhibited and the interest taken in the project would seem to insure its success, but the assistance given by the United States Government will of itself go far toward making the Cotton States and International Exposition worthy of a place in the annals of industrial shows. Out of an appropriation of \$200,000 authorized by Congress a building with a floor space of 14 acres is being erected, and in it will be installed exhibits of the various departments of the general Government, including a large display by the United States Fish Commission. Another

building now well under way, devoted to the Forestry and Mining, is being constructed by the Exposition Company, but is to be occupied by exhibits collected by and installed under the direction of Dr. David T. Day, Chief of the Division of Mineral Resources of the United States Geological Survey, and B. E. Fernow, Chief of the Forestry Division of the Department of Agriculture. This building covers about $\frac{1}{10}$ acre, one half of the space being assigned to mineral resources and metallurgical products, and one-half to forestry and industries connected therewith.

The Government has further fostered the enterprise by official sanction of invitations to foreign nations, and the exposition officers have given particular attention to securing exhibits from Mexico and South American States. The same customs arrangements are made for the Atlanta as for the Chicago exposition.

In addition to those mentioned prominent buildings are to be devoted to Administration, Fine Arts, Electricity, Machinery, Transportation, Manufactures, an Auditorium, a Woman's Building and a building erected by the labor of, paid for by the earnings of and to be filled with exhibits made by the colored people of the South, a novel and instructive conception.

The advanced stage of most of the larger buildings and the work done within the 200 acres devoted to exhibition purposes give promise that within the three and a half months between the present time and the opening of the show the grounds and structures will be in a most attractive state and ready for all exhibitors.

It is questionable whether the name given the exposition at Atlanta has not served to have it appreciated as a local or at best a sectional exhibition. Its primary object is to show what has been done in the States usually recognized as "the South," and to develop trade with Mexico and South American countries; but the management expresses a desire to draw exhibits from all parts of the world. As no portion of this country can advance without benefiting the whole, and as the development of the resources of any section must result in the advancement of our national wealth, all can rejoice in such a display as will awaken pride and encourage further development, even if this should be largely localized.

The aggregation of buildings, each devoted to specialties, the sizes of these structures and the area assigned to the exposition give to this enterprise a scope which should remove it from the list of local or provincial exhibitions.

The canal boat owners of New York State have decided to meet the competition of the railroads in the matter of freight rates.

Plans have been completed for an electric railroad between Philadelphia and Reading, a distance of 53 miles.

STEAM AND HOT WATER.

Apportioning Radiation.

BY UNIT.

At different times I have seen in *The Metal Worker* some excellent information on the subject of apportioning radiation, and I think that I can give some suggestions on this subject that will explain how some people can install a heating plant at a very low figure and thus secure a contract over their competitors. It is very demoralizing for a good fitter who works on his reputation to lose contract after contract to some man who is no better qualified to do work cheap than he is, and he oftentimes fails to understand how it is done. It has been said in *The Metal Worker*, and very correctly, that the secret of success lies in the correct apportioning of the radiation. Now, a little exposure of the method that our cheap friends use in calculation may be of advantage. An old hand at the game who was inclined to be a little garrulous opened his air vent and the following escaped:

"I do not think it is charitable to your neighbor to make him burn more coal than is necessary. Now, we all know that the old man and his wife do not live all over the house, and if you want to keep him happy the dining room must be not warm but hot, particularly in the morning. The only way to do this is to put a big radiator in that room. We also know that if the family is a growing one they will all go into the mother's room to dress, and if there is a big radiator there the upstairs is well heated. As most of the time of the family is spent in these two rooms a fair sized radiator in the sitting room will be satisfactory. You can reduce the radiators that are placed in the parlor, in the hall, in the different chambers way beyond what you would dare to if you did not calculate on the basis that I do. Now, don't you see that a heating plant of this kind won't cost a great deal for radiation, and if you haven't got so much radiation a size smaller boiler will do the work. Here is quite an item of saving when you are bidding for the work. If any trouble arises in a particularly cold spell it is not a very hard matter to increase the steam pressure which is carried on the boiler or to put the hot water job under a few pounds pressure. This will increase the temperature in the radiators and will probably increase the coal bill for a few days; but in the majority of cases the fact that the dining room and living room are warm will relieve you of any trouble. It is only when there is scant radiation all over the house and no one room can be kept warm that people do the hardest kicking. If a man finds out in a few years that he would rather have a larger boiler and more radiation he ought not to quarrel because you have saved him enough in the coal bill to pay for the changes and have at the same time made two blades of grass to grow where only one would have grown if a larger boiler and lots of radiation had been put in in the first place. Sometimes it is difficult to make the

customer see it in this light. In laying out a heating plant some people study the direction of the wind, the size of the windows and the location of the rooms; but if they give some little study to the habits of the family, the size of the family and the age of the members, and find out which rooms are used for certain purposes, they will be more successful in laying out their heating plants."

To a man who wants to build up a reputation for strictly first-class work the method of this old practitioner will not recommend itself very strongly, and it is quite probable that if the general public was aware of such methods they would steer clear of those who practice them.

Heating a German Theater.

The following is an extract from a letter of E. A. E. Woodrow in the *American Architect and Building News* describing the Frankfort Opera House, Frankfort, Germany, and refers to the heating system.

The greater space underneath the building is constructed in vaults used for the scheme of heating and ventilating, carried out under the same principles as the ventilation of the Vienna Opera House. The warming throughout is done by a system of steam pipes, and the fresh air in winter is warmed before it enters the building and in summer is cooled so as to be agreeable to the people who breathe it.

In the administrative rooms, dressing and rehearsal rooms, and, in fact, all other rooms used by the *personnel* of the theater, the warming is produced by means of coils placed in the window niches; the fresh air from without, as it passes into the room, comes in contact with these coils and enters the room suitably warmed; by means of a handle fixed on the window board the supply of air from without can be regulated to a nicety, and can even be entirely cut off, thus allowing the coil to act only on the air within the room. If required, when the room becomes too hot the steam can be cut off from the coils altogether.

In the walls of the rooms where this system of heating is adopted are flues opposite the windows, with grated openings into the flues just above the floor level and other openings at or near the ceiling level. In the winter the bad air, being dense, escapes by the lower outlets, while in summer it finds its way out by the upper extract flues and is by these conveyed to an extract cupola at the top of the building.

Now this method of warming, which I have just described, is adopted not only for the rooms behind the curtain, but for the stage and passages surrounding it also. The system used to heat the auditorium and parts of the building used by the public differs considerably from the foregoing, inasmuch as the air before being admitted at all into the parts occupied by the people is previously warmed or cooled in the vaults in the basement, being conveyed from thence in the manner usually in vogue where this system of heating is employed.

The basis upon which the heating and ventilation of the Frankfort Opera House is designed and carried out is to supply each of the 2000 spectators, whom the theater will hold with a supply of fresh air equal to 40 c. m. (about 1400 cubic feet) per hour. To do this the air is taken from the outside into a collecting room situated beneath the vestibule, and is conveyed from thence through two underground tunnels to both sides of the theater, which it enters through gratings.

The air is heated in the winter by being passed over large steam coils and is cooled in the summer by being forced through a three-fold curtain of water. The 80,000 c. m. (about 2,800,000 cubic feet) of pure air which is required every hour is drawn into the collecting chamber by means of a large fan, 3 m. (about 10 feet) in diameter, which is made to revolve from 90 to 120 revolutions per minute by means of a 15 horse-power engine.

The cold air chamber in the bottom story of the three-story basement communicates with the two upper stories of the basement by means of large perpendicular hanging cylinders of plate iron, fitted with covers. The air from the cold air chamber below passes through openings round the cylinders into the heating or middle chamber (which is heated by means of thin steam tubes) and ascends into the mixing chamber above; cold air also ascends by means of the cylinders from the cold air chamber (the lowest chamber) into the mixing chamber (the top chamber), pouring over the top of the cylinders and mixing with the warmed air which ascends from the hot air chamber (the middle chamber).

The air passes from the mixing chamber through perpendicular flues to the auditorium, various rooms, passages, &c., which it enters through gratings fixed just above the floor. In the area level of the auditorium the gratings formed under each seat are placed in the floor, but in the galleries the slits are made in the risers of the steps to the seating of the tiers. The extract gratings are placed in the ceiling over the seats and the foul air is conveyed through a series of channels or flues into large conduits, which culminate in one large central extract shaft below the cupola, the vitiated air finding its way finally to the outside through the lowered sides of the cupola.

The sun burner over the auditorium assists the system of ventilation, as it sets up a rising current of air, causing the air to become rarefied and ascend into the chamber in the roof, containing the heated tubes. Thus the whole of the air of the "house" has an upward motion, which is further increased by the pressure of the air from below.

If the quality of the inner and outer temperatures in summer requires a further means of expulsion, then an exhaust fan, which is placed close under the cupola, can be set in motion by means of a wire rope worked by an engine below. This fan, which is about the same size as the fan in the collecting chamber, is made to revolve some 15 or so revolutions per minute more than the fan below, so as to prevent any stagnation of the air in the theater.

In order to facilitate the working of

the various large valves, some of which are several meters square, which regulate the inflow as well as the outflow of the air, the machinery is all placed in one room located in a central position. Here the engineer watches the electric signals which announce to him the different temperatures in various parts of the building, and here he regulates the whole apparatus by turning on or off the steam valves and by making the fans revolve faster or slower as the exigencies of the case demand.

The building is protected from fire by means of a complete service of fire appliances, which supplement such provisions made by the architects against fire as massive walls, iron doors and sheet iron curtain separating the stage from the auditorium. All over the building, especially in places where a fire is most likely to break out, hydrants (numbering in all some 80) are distributed, and in addition to this the stage is further protected by a specially designed extinguishing apparatus placed on the gridiron, in the flies and in the cellar. This consists of a system of fine copper pipes which cross each other and from which, upon the fireman's opening the valves, a sheet of water can be produced flooding the whole of the stage. It is understood that this arrangement has been put to the test and found not wanting in its effects.

Wanted, a Rule for Steam Mains.

From M. S. E., Westminster, Md.—Will *The Metal Worker* please give me some data on steam fitting so that I may calculate the proper size of steam pipe to carry a given amount of radiation?

Answer.—The rule commonly observed by steam fitters is to calculate that each 100 feet of radiation will require in the main an area equal to that of a 1-inch pipe. This rule is varied in practice according to whether a one or two pipe system is used, and the size of the radiator to the work to be done, and also to correspond with the experience and judgment of the steam fitter.

A Boomerang.

BY W. E. R.

"They say a man will get so accustomed to lying that he doesn't know when he tells the truth." So said Jed Smith, one of the best salesmen in the steam and hot water line that ever took an order, to a party of drummers in the hotel sitting room one evening. "But that, I think, is putting it rather strong," he continued. "Of course there are some times when you fellows, as well as myself, will make some claims on the spur of the moment that would bother you considerably to substantiate." We all denied this assertion and told him to prove it, which, of course, he did not try to, and we were mighty glad he didn't. Jed then told us the following story:

"I didn't know what an accomplished liar I really was until one time when I had to go to B— to sell a boiler, in answer to a letter from the resident steam fitter there. Arriving at B— and finding my party's place, I went in." We had all settled down to listen attentively, as we knew Jed would entertain us with some escapade of his, and he had had many. "It was the ordinary little shop, a duplicate of which you can find in most any small

town. The proprietor proved to be a good hearted, honest Dutchman, named Grosmeir. He was not a German, but an out and out 'Dutchy.' After making my errand known to him, he said, 'Vell now, I vas sorry. I wait tree weeks and den upgifs you, den gets me dot boiler kysterda already.' And he looked awfully sorry, and acted as if he had done me a personal injury by not waiting until I got there.

"I saw at once where the trouble was. The firm had received his letter all right, but by the time the letter got to me and I got time to go to B—, Grosmeir had got his 'boiler.' Seeing there was no chance for a sale, I thought as I was there and could not catch a train for three hours, I would have some fun with him; so I told him that I also was very sorry, as I would like to have shown him our latest improved boiler, something simply wonderful. He took the bait nicely, and I continued: "'There have been great improvements in the last few years.' 'Yaw,' he replied with great emphasis, 'I extinkly remembers minself dot funtine years ago, dot if a feller wanted a hod water or steam boiler, he vould put in a hod air furnish, and thinks he vas putting styles on.' I didn't quite catch his argument, but agreed with him. We talked a few moments; and, just as I was going to give him a little coaxer, he asked: 'What vas dey about dot boiler you vas gone to show me?'"

"This was what I was waiting for, and I prepared to spread myself. 'Oh,' I said, 'you mean our centrifugal, compound, automatic generator.' Grosmeir looked hard at me, but I went on. 'Well, you know, as the people get more advanced, they want more labor saving appliances.' 'Yaw,' he broke in again, 'Ven dose lazy plumpers wants to vipe a sholnt, dey maige der kid do id, vile dey gomes around! Satsterday nite for dere vages by litening und tunder.' Again he was a point ahead of me, but I was full of my joke and didn't contradict him. 'Yes,' I said, 'and to meet this demand, our firm employed the whole corps of United States civil and uncivil engineers to construct the most perfect boiler of the present day. I will just give you a few of its most valuable points.

"'First, it has an aqua extractor.' " 'Vat?' said Grosmeir. 'That is the name of an appliance which extracts water from the air.' He looked a little puzzled, so I explained. 'You see there is a certain amount of water in the air.' (He had evidently learned that fact, for he nodded as though he understood. 'Well, this aqua extractor' (I pronounced it slowly so as to give him the full benefit of it) 'is a compound of chemicals in a tank near the boiler that extracts enough water out of the air to supply the boiler up to the water line. This, you see, saves all trouble about water.' Grosmeir's eyes opened a little but he said nothing. 'Then there is the heatoregometer.' 'Vat?' says Grosmeir. 'The heatoregometer. Ever heard of it?' He said he thought he had, but couldn't for 'shure zay.' 'Well,' I explained, 'this connects to each radiator, and if set to 70° the room would always be 70° hot, as the heatoregometer would close off or open up just enough sections to keep it at that temperature.' 'By chiminy!' he cried, 'dot was great.' 'Yes, indeed,' I replied, 'and what is more, it has a mechanical contrivance which works at 1 pound pressure, that puts on coal, shakes the grate, throws the ashes out of the ash pit and regulates the

amount of coal by a special style of thermometer which is placed outdoors.' Grosmeir's feelings were too great to be expressed in English, so he gave me the full benefit of them in Dutch. 'So you see,' I went on, 'with this style of boiler all you have to do is to dump a couple of tons of coal in the chute which leads to the boiler, start your fire, build a place to hold ashes in, and your house is warmed without any further attention until the coal is burned out, which would be in about two months or so.' Grosmeir hadn't a word to say either in Dutch or English. He accompanied me to the door and bid me good by, and I left him out on his stoop in the freezing cold, bareheaded and in his shirt sleeves, a perfect picture of amazement and profound thought.

"I blowed considerably about the sport I had had with him; although I was sorry afterward that I had not kept my mouth shut. About a month later I received a letter from the firm, saying that they had a letter from H. Grosmeir, in B—, for one of our latest center flued, confounded, generator, steam boilers, to carry about 400 feet of radiation; and he also wanted a water distractor and radiator regometer. They thought I had better see him and get a clearer statement as to what he wanted, adding that, as they found he was O. K. financially, they had shipped him a No. 4 steam boiler.

"Say, boys, that letter knocked me silly. I realized I was in a devil of a fix. But the only thing to do was to face the music, so I started for Grosmeir's. While on the train I had arranged a nice little tale to tell him; but after getting to his place my nerve sort of left me. When he told me that the boiler had been received all complete and asked when the other improvements would come I began to get uneasy.

"'Oh!' I replied, 'then you wanted our latest improvements. Well, that is unfortunate.' And I explained to him how the inventor had been suddenly killed just as we were about to put his invention on the market; and as he had trusted entirely to his memory about the chemicals used, his secret had died with him.

"'Vell,' he said, 'dot vos too bad; bud how boud dot regomeromer radgiator?'"

"'Oh, that worked by chemicals too,' I uneasily replied.

"'Yaw? Bud how boud dot machine vat runs dot coal und ash kerbishness; dot didn't work by comicals.'

"'For a moment I was stuck, and that moment was the crisis. Grosmeir tumbled to the whole racket. Talk about a mad Dutchman! He went for me first in English, then in Dutch, then in both. He made us not only take the boiler back, but pay him for his trouble and expense before he would give it up, which we did, rather than stand a lawsuit.

"I tell you I was a sick man, and that's the last time I ever misrepresented anything." And Jed sat back as though he actually believed this last statement himself.

A SECTION of the indirect radiator designed by Heating Engineer Fred P. Smith, Mohawk Building, Fifth Avenue, New York, for use in the Scranton High School was on exhibition at the showroom of the American Radiator Company, 92 Centre street, New York, this week and attracted a great deal of attention. It has a short vertical and a long horizontal chamber forming an angle, and is tapped at the side at both the top of the vertical and bottom of

the horizontal sections. The extended surface is of the web type, and is placed at an angle of 45° instead of vertically, as is customary. This is said to relieve the friction of the air passing over the radiator and to permit a stack of several layers of these sections to be used.

HEATING NOTES.

AMONG recent Illinois corporations is the Charles Smith Mfg. Company, at Chicago. Capital stock \$10,000; to manufacture boilers and furnaces; incorporators, J. H. Haswell, J. W. Armstrong Robert C. Morse.

AT THE ANNUAL MEETING of the stockholders of the Harrisburg Steam Heat & Power Company held at Harrisburg, Pa., last week, the following were elected directors: H. Cohen, W. M. Donaldson, T. D. Greenawalt, Thomas H. Heist, Wm. Jennings, Harry A. Kelker, H. B. Mitchell, E. B. Mitchell and Harry C. Ross.

J. A. GOODRICH, who has been connected with the American Radiator Company as the manager of their New York branch since the organization of the company, and was for several years previously with the Pierce Steam Heating Company, has resigned to enter other business.

D. R. McCALLUM, manager of the New York house, at 69 Centre street, of the J. H. McLain Company, Canton, Ohio, is remodeling his showroom previous to exhibiting the new things in the boiler line which will be offered to the trade this year.

GEO. H. WEYMOUTH, one of the salesmen of the W. H. Page Boiler Company, Norwich, Conn., turned in to the house orders for 34 Volunteer and All Right steam and hot water boilers, the result of 14 days' work. E. G. Whittaker, who is traveling in the vicinity of Pittsburgh, is sending in some good orders to the New York office, at 61 Gold street.

WESTERN PAUL STEAM SYSTEM COMPANY, Chicago, Ill., have been incorporated, with a capital stock of \$250,000, to manufacture steam and power plants. The incorporators are Kellogg Fairbank, Benjamin P. Hinmann, Jr., and Arthur W. Hale.

THE NEW SHOWROOM devoted to the Winchester steam and hot water boilers at 141 Centre street, New York, in charge of Secretary N. E. Frost of the Smith & Winchester Company, Boston, makes a very handsome display. The room is square with large windows at the back, where a convenient office is furnished with a red velvet carpet and quartered oak furniture and inclosed with a railing of polished brass pipe. The entrance is directly opposite, and raised platforms covered with red velvet carpet occupy the remaining wall space. At one side five sizes of the Winchester boiler for steam are arranged, painted black, white and garnet with gilt and silver lettering and ornamental bands. On the other side the Winchester boiler for hot water is decorated in a similar manner, making a very attractive line of goods. At one side of the showroom *portières* drape the entrance to their pump and windmill showroom. Aside from these special lines the Smith & Winchester Company make a specialty of "Everything" for steam, water and gas fitting, with a large line of sanitary fixtures and appliances.

THE new surface burning Florida boiler in the showroom of the American Boiler Company, 94 Centre street, New York, brings a great many visitors to investigate its construction who are old and staunch friends of the base burning Florida.

Ventilation.

BY SAMUEL A. HEINS.

School Ventilation.

Again I wish to say something on the subject of ventilation, a subject that should be agitated and kept before the public, and they should be compelled to ventilate the public schools. That would be a very great benefit to the health of the pupils and the teachers. The depression and faintness from which many students suffer after being confined in a poorly ventilated school room is clearly traceable to vitiated air, while the evil is often ascribed to excessive mental exertion. The effect of ventilation upon the health of students is a subject of universal interest to parents and educators and should receive more attention. I have visited a number of schoolrooms and found the air in all offensive to the smell, the odor being such as one would imagine old boots, dirty clothes and perspiration would make if boiled down together. In a school that should be ventilated the hot air enters at two registers in the floor on one side and makes (or is supposed to make) its exit by a ventilator at the floor on the other side of the room. The master said the air was supposed to have some degree of intelligence and to know that the ventilator was its proper exit. Thorough ventilation has been neglected by many school officials on account of the increased expense it causes. In our climate, during seven months at least, pure atmospheric air must be paid for. The construction of vertical ducts, the extra amount of fuel and the attendant expenditures are the objections which in the opinion of many persons outweigh the health and happiness of the future generation. It is necessary for the proper ventilation of our schoolrooms that an adequate supply of fresh air should be admitted to the room and should be discharged as contaminated after its expiration. The proper ventilation of the schoolroom consists in the warming and introduction of fresh air from without and the discharge of the expired and unwholesome air from within. This may be accomplished by means of doors, windows, chimneys and finally by ventilators—one placed near the level of the floor and the other near the ceiling of the room, the ventilators to be arranged on the opposite sides of the room in order to insure a current and an abundant supply of air. When trustees and patrons realize that pure air is absolutely essential to health, and that their children are being slowly poisoned by the foul air of schoolrooms, then they will construct our halls of learning with a due regard for the laws of hygiene, and students will not droop under their tasks on account of the absence of nature's most bountiful gift—pure air.

The ventilation of factories and workshops is a subject which demands the immediate attention of manufacturers and employers. The odors of oil, coal gas and animal products render the air foul and stagnant and often give rise to diseases among operators. From 200 to 400 persons are often confined in workshops 600 feet long with no means of ventilation except windows on one side only. The air is breathed and re-breathed until the operators complain of languor and headache, which they attribute to overwork. The real cause of the headache is the inhalation of foul air at every expansion of the lungs. If the proprietors would provide efficient

means for ventilating their workshops the cost of construction would be repaid with compound interest in the better health of their operators and the consequent increased product of their labor. Our manufacturers must learn and practice the great principle of political economy—namely, that the interests of the laborer and employer are mutual.

Not less important is the ventilation of our dwellings. Each apartment should be provided with some channel for the escape of the noxious vapors constantly accumulating. Most of the tenements occupied by the poor of our cities are literally dens of poison. Their children inhale disease with their earliest breath. What wonder that our streets are filled with squalid, wan visaged children. Charity indeed visits these miserable homes, bringing garments and food to their half famished inmates, but she has been slow to learn that fresh air is just as essential to life as food or clothing. Care should be taken by the public authorities of every city that its tenement houses do not degenerate into foul hovels like those of the poor English laborer so graphically portrayed by Dickens. But ill ventilated rooms are not found exclusively in the abodes of the poor. True, in the homes of luxury the effects of vitiated air is modified by food, &c. Men of wealth give far more attention to the architecture and adornment of their houses, to costly decorations and expensive furniture than to proper ventilation. Farmers, too, are careless in the construction of their cottages; their dwellings are often built, for convenience, in too close proximity to the barn. Because they do not construct a suitable sewer or drain the filth and refuse food is thrown out of the back door, where it accumulates and undergoes putrefaction. The vitiated air penetrates the interior of the house and there being no means of ventilation it remains to be breathed by the occupants. The result is that for the sake of saving a few dollars which ought to be expended in the construction of necessary flues and sewers the farmer often sees the child he prizes far more than his broad acres gradually decline or suddenly fall a victim to fevers or malignant disease. Parents, make your homes healthy; let in the fresh, pure air and bright sunlight so that your conscience may never upbraid you with being neglectful of the health and lives of your little ones!

Sailing vessels are having a hard time in finding sufficient freight at the Atlantic ports of this country just now. After being in port at New York more than a month, the fast iron sailing ship "Liverpool," finding it impossible to obtain freight, took her departure last week for St. John, N. B., in tow of a powerful tug. Recently, also, the four masted ship "Eulomene," after unsuccessfully seeking a cargo at the same port, was dispatched by her owners to New South Wales, the first time a vessel has been sent from New York on such a long voyage in search of cargo.

Plans have been submitted by the New York, New Haven & Hartford Railroad for four-tracking the Providence division for 5 miles through the center of Boston, building a number of bridges and making other improvements all along the roadway. The contemplated improvements will, it is said, cost several million dollars.

THE RETAIL STORE.

The Petersen Mangle.

Petersen & Fischer, 166 Pierrepont street, Brooklyn, N. Y., are introducing the mangle herewith illustrated. It consists of three wooden rollers, the top and bottom ones being revolved by the use of a crank and gearing. The middle roller is revolved by contact with the ones above and below it, the pressure being regulated by the hand lever. In use the lever is raised to

ing and closing of the dampers are effected by means of a spring connected with a rod resting against the top of the door. This is regarded by the manufacturers as one of the most valuable improvements ever made in refrigerators. The drip cup or trap consists of a good sized cup, into which the lower part of the drip pipe extends so as to form a trap when but partly filled with water. A rod attached to the cup enables it to be pulled downward and completely

The Petersen Mangle.

allow the middle roller to be removed, around which the article to be mangled is wrapped. The roller is then replaced in the frame, and with the left hand on the lever to regulate the pressure, the crank is turned with the right hand. When the mangling is completed the article is removed from the roller. The point is made that no heat is required in connection with the mangle. The machine is designed for use in the household for mangling sheets, tablecloths, napkins, handkerchiefs and other flat pieces. It is referred to as cheap, durable and useful; as saving labor, time and coal; as retaining the fresh smell of the clothes; as preserving their fabric; as simple in construction, with no parts which can get out of order, and as being used with ease by any person. All parts of the mangle are interchangeable, and extra rollers can be obtained. The machine is designed to retail at \$5.

New Perfection Refrigerators.

The Belding Mfg. Company, Belding, Mich., have introduced a number of improvements in their refrigerators this season. Conspicuous among these new features is their automatic cold air damper attachment. This device consists of hinged metal dampers which completely close the opening between the ice chamber and the provision chamber when the door of the latter is opened. Thus the passage of warm outside air over the ice is prevented, necessarily economizing in the consumption of ice, particularly in cases in which the doors of a refrigerator are opened very frequently. The automatic open-

ing and closing of the dampers are effected by means of a spring connected with a rod resting against the top of the door. This is regarded by the manufacturers as one of the most valuable improvements ever made in refrigerators. The drip cup or trap consists of a good sized cup, into which the lower part of the drip pipe extends so as to form a trap when but partly filled with water. A rod attached to the cup enables it to be pulled downward and completely

The Eclipse Refrigerator.

The new Eclipse refrigerator is patented and manufactured by the Bowen Mfg. Company of Fond du Lac, Wis. They state that the interior of the refrigerator is constructed entirely of metal, with no wood exposed to moisture. The walls are lined with zinc, soldered perfectly air and water tight. The ice chamber is constructed of heavy galvanized iron in such a manner that the ice is suspended and not permitted to touch the refrigerator walls at any point; hence it is impossible for the walls to become moist and dampness to enter the casing, causing impure odors, &c. The bottom of the ice chamber is a pan of extra heavy galvanized iron, separated at all points from and fastened securely to the casing walls. The four walls of the ice compartment, united to form a frame, are separable from the bottom and removable for cleaning. A removable drip pan is sus-

pended to the bottom of the separable ice chamber, which makes it impossible for moisture resulting from condensation to drip into the provision chamber. The patented ice rack is a corrugated plate, riveted to heavy bands of iron, which are bent to form its legs. The plate is bent upwardly at its sides to prevent the waste water flowing over except at its end nearest the outlet. The ice rack, bottom and drip pan slope toward the drip pipe, insuring prompt drainage of the waste water. The drip pipe is located at the side of the refrigerator, where it is in view and where the waste basin can easily be removed. The drip pan and bottom beneath the ice rack have openings through which the cold air passes into the provision chamber, forcing the warmer air upwardly along the four sides of the removable walls through the apertures above and back on to the ice without coming in contact with the descending cold air, thus providing a perfect circulation and making it possible to reach an extremely low temperature in the quickest possible manner. The case is made of selected ash, beautifully carved, and finished in antique with best filler, shellac and coach varnish. The locks and hinges are of solid bronze. The refrigerator has self retaining casters and the walls are filled with mineral wool.

The Asbestos Torch.

Asbestos Torch Company, 153 Milk street, Boston, are offering the torch here shown. It consists of a metallic bowl, hung to swing, and is filled with asbestos, which when in use is saturated with kerosene oil. The asbestos remains uninjured by the flame and can be used indefinitely as an absorbent. The torch is designed for use in night fishing; also for the extermination of caterpillars,

The Asbestos Torch.

moths and all troublesome insects and grubs that infest trees, shrubs and plants. The point is made that when the torch is held under caterpillars' nests and is passed under the branches and around the trunks of trees where insects lodge the heat instantly destroys the insects and that it will in no way injure the trees, thus saving annually much loss and vexation.

Boss Lemon Squeezers.

§ The accompanying illustrations represent wood lemon squeezers of fancy shapes, put on the market by John

Columbian Kitchen Spoon.

M. L. Schoch, 47 North Tenth street, Philadelphia, is putting on the market the kitchen spoon shown in the accom-

made in two styles, tinned and nickel plated.

Stove and Hardware Dealers of Kingston, N. Y., and Vicinity.

BY HENDRICK.

The old city of Kingston, originally known as Esopus, aside from its enterprising stove and hardware dealers, has much of historical interest. It was one of the first settlements of the State and is justly proud of being the place where the constitution of the State of New York was adopted and where the first Legislature met. This constitution was framed in 1777, in the old stone house built by Col. Wesel Ten Broeck in 1676, which still stands well preserved through centuries of change. Among the places of interest is the old State House on the west side of Clinton avenue, which carries the thoughts of the visitor back to the first settlement of Kingston by the Dutch in 1614. The first Dutch Church stands in the old town churchyard, where yet rings out to the congregation the silver bell cast from plate contributed by the old churches for the purpose. At present and not least in importance in this historical place are the stove and hardware dealers.

Adjoining the old State House is the large building where F. Gallagher carries on the stove and tin business. Fred, as he is known, has not been in business as long as the old State House has been built, for it was in 1854 that the business was established by his father, and which, since the latter's death a few years ago, he has successfully carried on. The long sign on which Mr. Gallagher's name appears is peculiar in some respects and is one well calculated to attract the attention of the passers by. It hangs across the walk and extends somewhat out into the street. Suspended from it by hooks are milk and water pails, coal scuttles and other articles usually found in a tin shop, but seldom found in the position in which they are here placed. For his leading lines he handles the Andes, made by the Phillips & Clark Stove Company; the P. P. Stewart and Splendid parlor stoves, made by the Fuller & Warren Company; the Welcome, made by the Syracuse Stove Works; the West Shore, made by the Littlefield Stove Company, and the Manhattan ranges, made by Eugene Munsell & Co. As early as August 15 Mr. Gallagher's full line of parlor stoves are displayed on the sample floor ready for the fall business. This idea of early sampling he considers a good one, as people begin looking for parlor stoves as early as August. Mr. Gallagher also does considerable in the way of tin roofing and general jobbing, in addition to the hot air furnace work in which he is extensively engaged, being the agent for the Perfect, made by the Richardson & Boynton Company.

Davis & Hoffman occupy a large building known as the Arcade, which stands at the head of the main street. This concern carries a full and complete assortment of the Red Cross stoves and ranges made by the Rochester Co-operative Foundry Company. The main part of the store, which is about 30 x 40 feet in size, is given up to stoves and tinware, the office being in the rear and the tin shop in the basement, this arrangement making it convenient to handle heavy goods. The firm enjoy an excellent trade in the Howard furnaces made by the Howard Furnace Company, for which the concern are Kingston agents.

Nicholas Murphy does a general jobbing and tinning business as well as handling the Sure Luck stoves made

Fig. 1.—Boss Lemon Squeezer.

Sommer's Son, 355-365 Central avenue, Newark, N. J. The body of the squeezers is made of sugar maple, well finished, with bowls of rosewood, lignum-

panying illustrations. Fig. 1 shows the spoon having a false or movable back attached to a wire rod which passes underneath the stem and enters

Fig. 2.—Boss Lemon Squeezer, Porcelain Bowl.

vise, imitation mahogany and porcelain. The bowls are 3 inches in diameter and $\frac{1}{2}$ inch thick, better and stronger, it is stated, than this class of goods ordinarily are. The squeezers are trimmed

the handle. A cross bar is fastened to the wire at about the middle. In use the spoon is cleared of its contents by a movement of the cross bar in the direction of the bowl, when the false back is

Fig. 1.—Columbia Kitchen Spoon.

with overlapping end hinges of brass nickel plated, brass not plated, and of steel. The point is made that the squeezers are superior to those made of iron, tinned or japanned; that they

carried to the mouth and effectually empties the bowl. Fig. 2 shows the spoon with the false back or scraper moved toward the mouth of the spoon. The spoon is designed particularly for

Fig. 2.—Columbia Kitchen Spoon, Showing Scraper.

will not break or crush; that there is no danger of parts rusting or corroding, as they are all of wood and porcelain, and that they are easily kept clean and suitable for use.

use with puddings, batter, ice cream, mashed potatoes and other preparations having a tendency to stick to a spoon, but may be used in all cases where an ordinary spoon is used. The spoon is

by Burdett, Smith & Co., the Manhattan ranges and heaters made by Eugene Munsell & Co. and the Sunshine line of stoves and ranges made by the Reading Stove Works. Mr. Murphy has been in business at the stand he now occupies for many years and has noted the numerous changes which have taken place in the manufacture of stoves. He believes with many others that the steam and hot water heater and the hot air furnace are slowly but surely supplanting the high and medium priced base burners.

A little way up the street from the Eagle are the showrooms of Bernard Loughran. Barney, as his friends call him, does an extensive business in steam and hot water heating, plumbing, gas fitting, &c. In his showrooms is to be found an attractive display of the latest patterns of bathtubs, closets and other plumbing specialties. At the left of his store as one enters can be noticed an interesting display of the French Manhattan stoves, made by Eugene Munsell & Co., and the Magee Grand ranges, produced by the Magee Furnace Company. In his steam and hot water heating contracts he uses the Gurney heaters, which he says have given excellent results.

Charles Reynolds is another enterprising dealer in the historic town of Kingston, and meets the wants of the trade in a prompt and satisfactory manner. He carries a full stock of heavy and shelf hardware, mechanics' tools, agricultural implements, &c., and is alive to the requirements of the times.

T. J. Cusack has recently moved from his old store on Fair street to new and handsomely equipped quarters at 45 North Front street. The main floor is devoted almost exclusively to the display of bathtubs, closets and specimens of fine plumbing. The showroom is fitted up to represent a kitchen of the present day, all of which is sure to attract the passers by and especially those in search of fine kitchen and bathroom furnishings.

One of Kingston's long established stove and tinware stores is that of F. S. Thompson, where can be found one of the largest and most complete lines of stoves in the county. Mr. Thompson has for many years made a specialty of the Acorn line of stoves, ranges and heaters made by Rathbone, Sard & Co. The large store room is almost wholly given up to the display of this well known line of goods. Mr. Thompson also manufactures tin, copper and sheet iron ware and does considerable business in hot air heating.

L. S. Winne & Co. carry on an extensive wholesale and retail hardware business, occupying a spacious building near the post office. The store is modern in construction and systematically arranged, the shelf hardware being cased in boxes with samples exposed. The trade of the concern covers many miles through Ulster and adjoining counties.

In that part of the city known as "Rondout" is the plumbing and tinning establishment of the Canfield Stove Company, who represent the Perry Stove Company and the Rochester Co-operative Foundry Company. In their salesroom is displayed a full assortment of the Argand and Red Cross lines made by the concerns named. The business of the Canfield Stove Company was established many years ago by the late A. P. Canfield. A large trade is done in steam and hot water heating, and the company are agents for the Richmond steam and hot water heaters and the Perfect hot air furnace. They have recently remodeled their building so that it is now three stories in height. The first floor is used for store and office purposes, while the second is given up to the plumbing and tinning

departments. An elevator has been put in, making it easier to handle goods. The store has a frontage on the main street as well as on Ferry street, and with the present facilities the company are in a position to handle a much larger business than heretofore.

Prominently located on Union avenue is the capacious store of Henry E. Weiber, who is engaged in the retail stove and hardware business, giving special attention to plumbing, steam, hot water and hot air heating, &c. His leading lines of stoves and ranges are the Andes, made by the Phillips & Clark Stove Company, and the Welcome, made by the Syracuse Stove Works. Mr. Weiber does considerable business with the large hotels and boarding houses in the mountains and has recently established a branch store at Tannersville, located a few miles up in the Catskills. He is one of those

tools and agricultural implements. They occupy a large building opposite the Mansion House and are on the corner. The firm do an extensive business with the river transportation companies in addition to a large and growing city trade.

John F. Halloran carries on a plumbing and tinning business, making a specialty of the Sterling stoves and ranges, made, by the Sill Stove Works. He carries a complete assortment of tinware and is also the Kingston agent for the Hudson stoves and ranges.

Jansen Hasbrouck carries a full and complete assortment of heavy and shelf hardware and is one of Kingston's leading dealers.

The Buffalo Co-operative Stove Company are represented by James Murphy, who carries samples of different styles of their line, buying them through the Eastern New York agents, Burtis & Co. Mr. Murphy

The U. S. A. Stove Pipe Damper.—Fig. 1.—General View of Damper.

Fig. 2.—Damper Shaft.

men who, starting out with but little capital, has built up a large business and occupies at the present time one of the most finely equipped steam heating and plumbing establishments in that section. He is rather prominent in city politics and recently held an important office.

Somewhat back from the main street is the stove and tin store of Enoch Carter, who has been in the business for many years and enjoys an excellent trade. The leading stoves and ranges which he handles are the Columbia, made by the Keeley Stove Company and the West Shore range, made by the Littlefield Stove Company. Mr. Carter believes in establishing a reputation for the stoves which he handles, for then, he says, it is an easy matter to sell them. "They come in and ask the price, saying 'Send it up' and seem to know at once that it is what they want." Mr. Carter has sold nearly 400 West Shore ranges in the few years he has been pushing them. He does considerable plumbing and tinning and carries a full stock of tin and sheet iron ware—in fact, a kitchen can be completely furnished at his store. His son has an office with him, doing business in stencils and rubber stamps of all descriptions, and assists Mr. Carter with the bookkeeping.

McMillan & Johnson are dealers in heavy and shelf hardware, mechanics'

also does considerable tin roofing and general jobbing.

(To be continued.)

The U. S. A. Stove Pipe Damper.

We show in the accompanying illustrations a damper that is being put on the market by Peck, Stow & Wilcox Company, Southington, Conn., and 27 Chambers street, New York. The damper is made of wrought iron and steel and is light in weight. The manufacturers mention that it holds its place firmly in the pipe and the position is always indicated by the wooden handle. It has a bearing in the pipe from outside to outside and is securely locked in the pipe, which is expanded at right angles to the shaft so that the damper is always free to work easily. The damper plate, as shown in Fig. 1, which is a general view of it, is made with a recess cut out of the opposite edges to carry the burr made in punching the hole when the shaft is inserted. A general view of the shaft is shown in Fig. 2. The holes of the damper are small and can be punched by hand with the steel damper shaft itself. The oval wooden handle is a single piece of hard wood securely riveted to the damper shaft so that it cannot become loose. It is separated

from the pipe by a bell shaped steel spring and a washer. It is pointed out that the spring acts on the pipe, compressing it, thus forming a double spring, either of which will hold the damper firmly in any desired position. It is mentioned that the bearing against the pipe and the corrugations prevent the damper from warping. It will be noticed that the shaft has the thread cut up a long distance so that it may be shortened when used for smaller dampers. The dampers are made in six sizes, from 4 to 7 inches, and are packed, with shafts inserted in the damper plates, in paper boxes holding a dozen each.

The Standard Watering Pot.

The Cleveland Stamping & Tool Company, Cleveland, Ohio, are offering the watering pot here shown. It is ex-

The Standard Watering Pot.

plained that the opening of the can is so arranged that the water will not splash out while carrying or when in use, and that the handle is so placed that it balances the can when filled or empty, so that the pot is much lighter to carry than the ordinary style of watering pot. The pots are made in six sizes—6, 8, 10, 12, 14 and 16 quarts.

Devore's Damper.

An illustration is given herewith of a new damper which has been brought out by L. M. Devore & Co., Freeport, Ill. The cut shows the spindle separated from the body of the damper in order to demonstrate the construction more plainly. The spindle is securely fastened in place by a new locking device, consisting of a coiled spring attached between the handle and a shoulder cast

Devore's Damper.

on the blade. A lug is cast on the spindle, so that when the handle is pushed in the lug will turn in a small opening on the side, the tension on the spring will be relieved and the spindle can be pulled out. The operation is reversed in putting the spindle in. The method of application is very simple, but the device holds the damper rigidly secure to the spindle. The handle is of wood, which is fastened securely to the end of the spindle so that it cannot get loose or drop out.

E. RUDIN has removed his tin shop and stove repair business to 203 West Twenty-seventh street, New York.

American Damper and Damper Clip.

The accompanying cuts represent a damper and a damper clip offered by

Fig. 1.—The American Damper.

the Griswold Mfg. Company, Erie, Pa. The damper, Fig. 1, is referred to as having an improved and strong catch,

an extra long and sharp pointed spindle and an enameled wood handle. The damper is also made with full nickeled handle, in all sizes. The damper is made, in addition to the foregoing, in several sizes, with solid plates for use in gas stove and hot air pipes. The damper clip, Fig. 2, is made with the same spring, handle and catch as the

Fig. 2.—The American Damper Clip.

damper. A tall piece is provided when the clip is to be used in large pipes, made of malleable iron, with rivets cast on in one piece.

The Victor Double Trolley Store Ladder.

The illustrations presented herewith show the general appearance and method of operating the Victor double trolley store ladder, which is manufactured by the Coburn Trolley Track Mfg. Company, Holyoke, Mass. Fig. 1 shows the ladder in use, while Fig. 2 shows it pushed up against the sides of the shelves. There are wheels on the bottom of the ladder supporting it on the floor, so that no track is necessary. In Fig. 1 the ladder is in convenient position for use and when pushed back, as in Fig. 2, it is entirely out of the way, or in case a counter is used it is pushed back to the edge of the counter. This change of position is provided for by the carriage at the top, which carries the rollers so that the ladder may slide up and down on the side of the carriage. This adjustment of the ladder is particularly alluded to as an advantage in places

where space must be economized. A section of the ladder is shown in Fig. 3, which is bent at the counter so that it does not project so far into the room. In the illustrations the Victor track is provided for both the upper and lower shelves. It is mentioned that where a ladder cannot roll on the floor this is the most desirable form despite the somewhat extra

Fig. 1.

Fig. 2.

The Victor Double Trolley Store Ladder. The Horizontal Trolley Store Ladder.

expense. The track, it is stated, may be applied to any shelf below the counter ledge or directly on the edge of the counter and at any shelf above it within 6 or 8 inches of the ceiling or projecting cornice that might hit the top of the ladder. A special claim made for the apparatus is that it runs noiselessly. The iron work on the lad-

Fig. 3.—Bent Ladder with Two Tracks.

ders is finished in either gold or aluminum bronze. The trolleys have roller bearings requiring neither oil, soap nor other lubricator.

D. A. RIMES, dealer in stoves, hardware and tinware, has moved his business from Texarkana, Ark., to Winthrop, Ark.

A British Parliamentary return just issued states the traffic of last year through the Suez Canal shows an increase of 380,107 tons as compared with that of 1893, and of 327,146 tons as compared with that of 1892. The amount of dues received has risen from \$14,133,472 in 1893 to \$14,755,365 in 1894. The number of vessels which passed through the canal last year was 3352, of which 2386 carried the British flag, being almost precisely the same proportion as for 1893. The percentage of German, French, Dutch, Norwegian and Italian vessels using the canal has slightly declined.

STOVE TRADE NOTES.

The Ohio Stove Trade.

There is scarcely anything in the position of the stove and range foundries in this section of a discouraging nature. As a rule orders for old patterns are fully up to the expectations and the demand for new specialties far exceeds anticipations. Labor is finding fuller and more profitable employment, which is the basis upon which most manufacturers build their hopes of prosperity. The only doubt which may creep in will be through the difficulty in obtaining higher prices for the output of the foundries which must necessarily follow the increased cost of production arising from high wages to operatives and the increased cost of fuel and pig iron, both of the latter having already appreciated, and the tendency is toward a still further advance. But workmanship and merit count for much, and with the fuller resumption of business there will be less disposition to purchase goods upon the erroneous basis of cheapness which recently has too often governed trade.

Very few manufacturers are not running full time, the principal exceptions being where improvements making interfere with full operations. Where figures are furnished respecting the volume of business a steady gain is recorded over the past year and in many cases over the corresponding periods of two years ago.

Special efforts are being made among manufacturers to organize for mutual protection and assistance by controlling or shaping wise legislation and the extension of business, both at home and abroad. There is unusual activity in this respect in Cincinnati at the present moment and the outlook is remarkably encouraging.

The Milwaukee Gas Stove Company,

Milwaukee, Wis., have issued new catalogues of their gas appliances for the season of 1895-6. One of these catalogues is devoted to gas radiators, heaters and parlor grates. It contains illustrations and full detailed descriptions of Perfection gas grates, adapted to the use of any kind of gas; Perfection eight-flue, six-flue and four-flue radiators, intended for artificial gas only, but arranged to burn either a blue or an illuminating flame; asbestos front round heaters in three sizes; polished copper reflector front round heaters in three sizes; a square register heater and a square asbestos heater. The second catalogue is considerably larger, including gas cooking devices as well as heaters. Eleven pages are used in illustrating ranges, a number of new styles having been brought out for this season. The latter

are four-hole ranges, in very handsome dress, with and without water heaters, but furnished with the company's patent self-cleaning burners, adjustable valves and telescoping oven burners, which can be lighted and regulated from the outside. Other forms of cooking goods shown are portable stoves with one or more burners and new styles of hot plates. In addition to the company's full line of heaters they also show in this catalogue their gas kilns for firing china, tinners' soldering furnaces, family coffee roasters, &c. The third catalogue is a photo-reduction of the second, reproducing the entire catalogue in miniature, presenting a very dainty brochure for general distribution by merchants.

Duffy-Trowbridge Stove Mfg. Company,

with foundry and general offices at Hannibal, Mo., have issued their 1895-96 catalogue and price-list of Golden Rule stoves and ranges. The 80 pages of letterpress composing the volume are bound in paper covers, embellished with a side title in old gold printed upon a background of deep chocolate color. The opening pages are devoted to a statement of terms, freight, cartage, telegraphic code, &c., after which attention is given to the Golden Rule range. Among the many features of construction embodied in this stove may be mentioned Duffy's patent reversible front grate, pedal oven door opener, Duffy's patent reversible bottom grate, interchangeable sectional fire back, corrugated bottom oven plate, extra large flues, cut top and center, double ventilated oven doors, large ash pan, draw out hearth, &c. The range is adapted for soft coal, hard coal, coke or wood, and is offered to the trade in four sizes and the usual modifications. The Silver Rule, a new range made both four and six hole, embodies the latest features and is offered at a low price for a range of its class. The Golden Rule for wood only is an attractive four-hole construction, in which are incorporated the modern features. It is offered in two sizes and several styles. The Farmer's Daughter, a four and six hole range for wood; the Golden Rule, four-hole cook stove; the Silver Rule, the Iron Rule, the Home Rule, the Golden Rule, Farmer's Daughter, Cotton Belt and the Elm Rule cooks are some of the other goods illustrated and described. The Monarch steel range is another specialty which is given a place in the catalogue before us. The heating stoves are creditably represented, with the Golden Rule air tight for 1895 in the leading place. This is a richly treated heater adapted for burning soft coal, hard coal or coke. It is of the latest construction and is offered in two sizes. The Golden Rule oak, the Iron Age cannon, the Maple Rule and Glenwood cottage parlor stoves and the Golden Rule Todd complete the assortment. The closing pages are devoted to miscellaneous goods of interest in this general connection.

The Free Press of May 19 contains the announcement that the stove mounters of Detroit, Mich., have entered upon the active operation of the

recent beneficiary feature of their organization. Hereafter those paying the dues will be entitled to \$5 a week when sick and \$100 at death.

ODD PLATES.

IT IS STATED by a local paper that a movement is on foot in Charleston, Ill., looking to the operation in the near future of the Bain Stove Foundry in that place. The names of those associated with the movement are Major Connelly, Ed. Orr and C. F. McFarland.

THE FOX FURNACE COMPANY, 38 Vincent street, Cleveland, Ohio, have been compelled on account of increasing business to seek additional quarters and have taken the store at the corner of Seneca and Noble streets, where they have a space 40 x 100 feet in size. This space, in addition to what they already had, places the company in a position to promptly handle their increasing trade. The new space will be used exclusively for mounting and storage of furnaces.

MARCUS A. DARY of Taunton, Mass., announces that having purchased the patterns of the ranges and furnaces, together with the castings, &c., manufactured by the Warren Foundry Company of Warren, R. I., he is prepared to fill orders for the line of Woodlawn constructions, consisting of the Woodlawn Grand, the Woodlawn A, the Woodlawn B, and the Cornus ranges, as well as the Woodlawn furnace.

THE PENINSULAR STOVE COMPANY of Detroit, Mich., favor us with samples of a new memorandum book which they purpose distributing among the trade during the coming season. The book is of a width which readily permits of its being carried in the vest pocket, and will be found useful to the dealer for entering names and addresses and making notes of the many little things for which a book of this kind is particularly adapted. The covers are embellished with prominent reference to the Peninsular stoves, ranges and furnaces, which are said to be "quick bakers, superior cookers and powerful heaters."

SOME ONE has been good enough to send us a photograph showing a section of the trades procession which occurred at Attica, Ind., on the Fourth of July of last year. The central feature of the picture is a truck or float, bearing the name of L. M. Green and carrying a sample of a richly decorated Garland base burner and a Garland cook stove. The float is arranged with sloping sides, upon which are neatly arranged samples of hardware, tinware, &c., while depending from the base of the float is a skirting embellished with enormous fac-similes of the Garland trade mark. The horses attached to the truck are partially covered with banners carrying the Garland trade-mark.

IN VIEW of the growing popularity and sale of sheet iron air tight stoves in all sections the stove trade throughout the country have watched with interest the outcome of the suit brought by the Hagye Stove Company of St. Louis against the Cole Mfg. Co. of Council Bluffs, Iowa, for infringement of the Hagye patents. The decision of

the United States Circuit Court in its April session at Council Bluffs, Iowa, fully sustained the Hagey claims in their broadest sense, and the decision renders a number of other concerns liable to infringement suits. The Cole Mfg. Co. of Council Bluffs, Iowa, state that they have acquired the right to use such portion of the Hagey patents as were infringed, for the entire term of the patents, and that they will largely increase the output of Cole's air tight heaters, both at their Chicago and Council Bluffs factories.

THE GEM CITY STOVE MFG. COMPANY of Quincy, Ill., have recently had assigned to them a patent for an oven granted to Folkert Kaempen, Jr., and William Wewers of that place. The oven is so constructed that the front, back, top and bottom consist of separate plates so joined together that they may be readily detached. This construction allows each or all of the oven plates to be removed or replaced without disturbing any of the parts forming the stove body proper. It also enables the oven to be readily repaired at slight expense, and there is furthermore an economy of labor in assembling the parts together at the factory.

JOHN B. LEE, proprietor of the Raven Stove Polish Company, Chicago, spent the winter in California on account of throat trouble, returned thoroughly well, and will be found by his customers at the old location, 82 Lake street. He has recently issued a circular giving copies of fine testimonials for Raven stove polish received from very prominent stove manufacturers who are using it.

THE MICHIGAN STOVE COMPANY send us a sample of a stove polishing mitten which they are now prepared to furnish their customers at a very low price, including the customers' names printed on each mitten. They suggest that it would pay stove merchants to give one with each stove sold, thus making a good advertising medium. The mittens are made of strong canvas, with a dauber on one side and a polisher on the other, composed of heavy felt. As the company well say, "It is a good thing."

HOFFMAN & BAUR have recently moved to 279 Lake street, Milwaukee, Wis., where they have secured much larger quarters for their business in furnace and sheet metal work. The building is of brick and consists of three stories and basement, covering a space 25 x 140 feet. The basement is used for the storage of furnaces and other heavy stock, the first floor for furnace pipe and cornice work, the second floor for general jobbing, chimney caps and ventilating department; the third floor for furnace work and mounting. They are very busy at present and orders are increasing. Prospects for an active building season in Milwaukee are very good.

THE DETROIT STOVE WORKS of Detroit, Mich., send us a clipping which they have received from their English agent referring to American stoves in England. The article grew out of a series of letters on "Warmth in the House," published in an English paper, and calls attention to the merits of the Crown Jewel stove, which has for many years past been well known and appreciated in England. Reference is made to the construction of the stove, the cost of fuel per day to run it, directions for operating it, and suggesting that applications be made for catalogues.

J. P. LINDEMANN & SON of Milwaukee, Wis., have issued an illustrated circular of the Gem air tight heater, which is made in two styles, one having Russia iron body and the other wrought steel. The stove has a swing damper

door for the easy removal of ashes and is economical in the use of fuel. It is referred to by the manufacturers as being strong, neat and durable.

THE NEW YORK HOUSE of the Central Oilgas Stove Company report a lively trade in their Radiant central craft oil stove and the Junior Oilgas stove. They are making some large shipments of lamp stoves from their line, which comprises 13 varieties of popular goods.

THE ESTATE of A. FROELICH, 289 Pearl street, New York, have put a long distance telephone in their office for the convenience of the stove trade in the vicinity of New York, and claim that while they cannot ship grates and brick by telephone, they can transmit repairs with dispatch.

THE TOLEDO STOVE COMPANY of Toledo, Ohio, have added to their assortment of stoves and heaters the Palace Gem, a very attractive construction embodying features which render it economical and powerful in operation. The company state that it will work equally well with hard or soft coal or wood, and that some of its features are large flues, unusual amount of radiating surface, perfect control of the fire and capacious cold air tubes. It is of rich design and is offered in a variety of sizes. The company are turning out an interesting variety of stoves of original design, one line of cooks and ranges embracing something like 176 styles. The manufacturers are conveniently located at the meeting point, as they put it, of stove material, with access to 23 railroads. A catalogue which they have issued shows the lines of goods manufactured and calls attention to the various features embodied in their construction. The officers of the company are George G. Metzger, president; George Detwiler, vice-president; J. J. Leonard, manager and treasurer, and George Snyder, secretary.

The Use of Flueless Stoves in Confined Rooms.

The following letter by Thomas Fletcher, the well-known English expert in the manufacture of gas appliances, is taken from an English journal. The letter is interesting, owing to the radical departure made from what it has been customary to accept:

The results of Dr. Haldane's researches, recently placed before the British Association, are of considerable importance to all users of gas for lighting and heating purposes. It has been frequently stated that the presence of carbon dioxide in the air (caused by combustion of gas) is injurious, and the persons who have made this statement, without any direct proof, have repeated it until, apparently, they actually believe it themselves.

It has for many years been well known to experts that a very much larger proportion of carbon dioxide than usually exists in the air can be inhaled without any injurious effect, and that this gas is really as inert as nitrogen, which is by far the largest constituent of the atmosphere, but Dr. Haldane's researches show clearly that an excessively large proportion of carbon dioxide may be inhaled with ordinary air without risk, and with little discomfort. Ordinary fresh air contains about one part of CO₂ in 3000; yet this may be increased one hundredfold before any difference can be appreciated in the respiration; i.e., the presence of 3 per cent. of this gas—100 times the normal quantity—can

only be appreciated by a chemical analysis, and not by persons breathing the mixture. When the percentage increases beyond this the person breathing it commences to pant, but even with 10 per cent. of CO₂ only temporary headache is produced, and there is no danger until the proportion rises to 18 per cent. Foul air in a room is not dangerous from any quantity of carbon dioxide which can be formed by combustion until the combustible itself is extinguished owing to want of oxygen; a candle goes out in an atmosphere containing 18 per cent. of oxygen, instead of the usual 21 per cent., and $\frac{2}{3}$ per cent. of carbon dioxide; i.e., human beings can live and breathe in an atmosphere which will not support the combustion of a candle, and the experiments show that in colliery explosions the carbon dioxide formed is not sufficient to affect life unless the oxygen is almost entirely removed, and Dr. Lorrain Smith found that he could breathe ordinary air from which the oxygen had been removed without inconvenience or visible effect.

We may safely take it for granted that any amount of carbon dioxide formed by the combustion of coal gas in an ordinary room, under ordinary conditions, would be inappreciable, except to delicate chemical analysis, and that the only possible products of combustion from this source which could be injurious are sulphurous and sulphuric acids and carbon monoxide. The two former are unpleasant, but so stretch of imagination could consider them more than this; the last is undoubtedly dangerous, but if the combustion is perfect recent careful researches show that it is not formed.

We appear to be brought to the fact that the products of combustion from gas lights and flueless gas stoves are inert, and, in the absence of sulphur compounds, are inappreciable to those persons who are in the room. The question remains, why is a room in which a flueless gas stove and ordinary gas lights are used so unpleasant, causing, in most cases, cold feet and headache? The answer is, I think, a very simple one. In a room warmed by radiant heat alone, by an open gas or coal fire, the temperature at the floor level will be found in every case at least the same if not higher than that of the upper part of the room. In certain parts near the fire a much higher temperature can be obtained at the floor level, and these parts of the room are always selected, instinctively, by those who wish to be seated in comfort.

With a flueless stove certain classes of burners are absolutely necessary; the flames must be free, and not obstructed by solid matter, such as asbestos, iron or fire clay, any of these causing the evolution of more or less carbon monoxide. Without these any large proportion of radiant heat is, so far as is known at present, impossible; the larger proportion in a flueless stove must, of necessity, be convected heat, which rises with the currents of air formed.

The natural consequence is that the temperature of the floor level will, in almost every case, be lower than that of the upper part of the room, and the old advice to keep your feet warm and your head cool is unattainable.

This does not matter in a bedroom, where the whole body is at one level, and although I am without much personal experience on this point, I believe it will be found that in bedrooms with a chimney which has a down draft flueless stoves may be used with perfect safety and comfort if they are made

with ordinary lighting burners; or, if the light is objectionable, with good atmospheric burners, the flames of which are clear, and unobstructed by any solid matter. My own experience is limited to a period of about three years, during which my private workshop, having no flue, was heated by a stove containing ordinary Bray's union jets. I worked in this for many hours each day, and felt no inconvenience, but I was standing, and constantly moving about. If I had been quietly seated for an hour or two the consequence would have been, as I have repeatedly proved, cold feet and a headache.

The matter is worthy of attention, and no doubt many of your readers will have an opportunity of testing the point raised in cases where invalids with diseases of the respiratory organs are confined to bedrooms in which a fire is impossible, owing to a down draft in the chimney. The question is an important one in many cases of lung disease, which have to be treated in private houses where proper heating arrangements are otherwise impossible. It must be clearly understood that I do not commit myself to any positive statements, except that the matter appears worthy of an extended practical trial; and the results, whether for or against, will be valuable.

THE TRIUMPH ESTIMATE BOOK is the title of a book distributed to the customers of the Craig Reynolds Foundry Company, Dayton, Ohio. It is presented by the company with the view of aiding in keeping a more systematic record of estimates for furnace work. One page is devoted to some suggestions on making estimates and adjusting the size of furnace and flues to be used. Another page gives a proposal and specification for furnace work. This is followed by illustrations showing the different furnaces made by the house and price-list for the same; after which comes an index to the estimates, there being room in the book for 50. Four pages are left for making estimates, leaving space for the name of the customer, the salesman, the class of building and its exposure and the points of the compass. The book is ruled so that each room may be described, with the volume of air required, size of register, quality, price, the length of the round pipe and the length of the square pipe. The second page of the estimate enumerates the items that would be required in the plant. The next two pages are blank for memoranda and bear at the top the important suggestion, "Let your figures show a profit."

Work is actively progressing on the new fortifications at Fort Delaware, in the Delaware River. The old buildings have been demolished, and foundations of unusual strength have been constructed at the south end of the island for the support of two powerful dynamite mounds, destined to guard the entrance to the Delaware River.

The Pennsylvania State Assembly has refused to indorse an appropriation of \$500,000 voted by the State Senate for the improvement of the Delaware River harbor. The city of Philadelphia has already made a generous appropriation to aid this necessary improvement, and provided the State had agreed to bear its share of the expense work would have been begun at once. The refusal of the State to do so has caused an indefinite postponement of the work.

The Legal Control of Ventilation.

BY WALTER B. SNOW.

In no way is the increased appreciation of the necessity of improved ventilation in public and manufacturing buildings better evidenced than in the laws which have been enacted for the purpose of compelling the introduction of ample and efficient means for producing the desired result. The common law recognizes the fact that no man has a right to do aught that affects the peace, the health or the comfort of another. And so we deem it a part of our inborn right that our neighbor shall be prevented from maintaining a nuisance, even if it is upon his own property. We may even complain of a far distant individual who pollutes our water supply at its source, and we expect the manufacturer to provide all proper safeguards against injury to employees from machines which they operate.

It is, then, perfectly reasonable that the patron of a theater should demand that the air therein be maintained in such a state of purity as not to be injurious, and certainly the parent should have a right to insist that his children be provided during their school hours with air that will maintain their mental and physical vigor. And so we have a logical reason for those laws and regulations which are so slowly finding their way onto the statute books of States and into the by laws of towns and boards of education.

To Massachusetts all honor is due for having been the pioneer in the beneficent movement. As long ago as 1888 there was enacted a law reading, "Every public building and every school house shall be ventilated in such a proper manner that the air shall not become so exhausted as to be injurious to the health of the persons present therein." Evidently this law does not definitely determine how to ventilate in "a proper manner," but the enforcement of the law was placed in the hands of the Inspection Department of the District Police, a body of men already well qualified for the work because of their experience in general factory inspection, and the minimum acceptable basis of 30 cubic feet of air per minute per person was adopted.

This has since been followed by a law covering manufacturing buildings as follows: "Every factory in which five or more persons are employed and every workshop in which five or more children, young persons or women are employed, shall, while work is carried on therein, be so ventilated that the air shall not become so exhausted and impure as to be injurious to the persons employed therein, and shall also be so ventilated as to render harmless, so far as practicable, all gases, vapors, dust or other impurities generated in the course of the manufacturing process or handicraft carried on therein, which may be injurious to health."

Under these laws the ventilation in the buildings of the State has greatly improved, and where the inspectors at first found considerable opposition to the enforcement of the law, they now meet with a very ready compliance and a fair degree of appreciation of its desirability.

The State of Connecticut followed this initiative by passing a law of similar import, thus: "Every schoolhouse shall be ventilated in such a manner that the air shall not be injurious to the health of the persons present therein." The regulation regarding factory ventilation is rather broad, reading: "All

factories and buildings where machinery shall be used shall be well ventilated. . . ."

In Ohio, Rhode Island, New Jersey, Michigan and Pennsylvania the regulation of ventilation is placed in the hands of the Inspectors of Factories, but with no definite instructions as to what constitutes acceptable ventilation. The State of New York has a law requiring 250 cubic feet of space for each employee between 6 a.m. and 6 p.m., and 400 cubic feet after 6 p.m. But the inspectors have the power to grant permits for less space provided a room is lighted by electricity and such lights burn during all the hours of labor.

Most of the large cities which are situated in States not possessing such laws have, by the action of their boards of education, to some degree determined the quality of ventilation to be provided in all school buildings within their limits. Thus Chicago and New York, through the engineers of their respective boards of education, design the ventilating and heating systems for their schools on a basis of a supply of 30 cubic feet of air per minute per occupant.

Many of the States have laws requiring the introduction of exhaust fans for certain purposes; thus Minnesota demands that "exhaust fans shall be provided for the purpose of carrying off dust from emery wheels and grindstones." The State of California has no direct law regarding ventilation, but the crowding of the Chinese in their quarter brought about what is known as the "Cubic Air law," which in part reads, "Every person who owns, leases, lets or hires to any person or persons any room or apartment in any building . . . for the purpose of a lodging or sleeping apartment, which room or apartment contains less than 500 cubic feet of space in the clear for each person so occupying such room or apartment, shall be deemed guilty of a misdemeanor, and shall, upon conviction thereof, be punished by a fine of not less than \$50 or more than \$500, or by imprisonment in the county jail, or by both such fine and imprisonment."

In a similar manner the occupant of such room is liable to a fine of from \$10 to \$50 or imprisonment. When the unhealthfulness of such crowding as is common among the Chinese is comprehended, the wisdom of such a law is evident.

Every indication now points to the enactment within the immediate future of further State laws in those States in which the control of ventilation has not heretofore been regarded as a matter to be regulated in this manner, and even where such enactments fail to materialize there will undoubtedly be such increased appreciation of the necessity of a change for the better that individual specifications will stipulate it and bidders will naturally provide for it.

The position of the manufacturers and contractors is, in fact, of importance as regards advancement in improved ventilation, for they are daily becoming better acquainted with its requirements and are more generally recommending apparatus of sufficient size to fulfill all the demands of good ventilation. By forming the habit of always first presenting the best to their possible customers—no matter if something of less capacity be finally purchased—they have it in their power not only to advance the good cause of ventilation, but eventually increase the gross amount of their sales or their contracts.

TRADE REPORT.

The Iron Market.

The Iron and Steel markets may well be pronounced buoyant. There is every proof that the consumption is expanding and the demand has certainly enlarged greatly, since many belated buyers are endeavoring to cover for the future.

The attitude of the Amalgamated Association will be watched with interest. Our dispatches indicate that there has been a prolonged struggle between the conservatives and those eager for a sharp advance.

Coke has sold recently at \$1 35, but it seems likely that the operators will get together and decree \$1.50 at oven, Connellsville, for delivery after July 1.

There is a good deal of activity in all lines of Finished Iron. The buying of Sheets has been heavy and there is a good run of orders for Plates.

In Foundry Iron both Southern and Northern furnaces threaten to make a further advance for all deliveries after July 1.

Pig Iron.—The advance in the price of standard Northern Iron in the New York market foreshadowed in our last report has come, and considerable business has been placed at the higher prices. In fact, buyers have been so quick to accept it and have shown so much disposition to contract ahead liberally that the leading companies have decided to let the advance stand only for June deliveries, and are declining to sell at the figure recently established beyond July 1. The aggregate sales have been quite heavy, and include also round amounts of some favorite Southern Irons. In one case a round block of Southern Iron has been sold for delivery during the balance of the year at a concession from top prices. We quote \$12.25 @ \$12.50 for No. 1; \$11.25 @ \$11.50 for No. 2, and \$10.75 @ \$11 for No. 2 Plain, and \$10.25 @ \$10.50, Northern brands, tidewater delivery. Southern Iron, same delivery, is selling at \$11.75 @ \$12.25 for No. 1; \$11 @ \$11.25 for No. 2; \$10.50 @ \$10.75 for No. 3; \$10.75 @ \$11 for No. 3 Soft, and \$11 @ \$11.25 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$10.25 @ \$10.50.

Advices from Philadelphia intimate that the demand for Pig Iron in that district is of the same satisfactory character as has been noted for two or three weeks past, makers having all they can do to make deliveries as rapidly as desired. Prices are firm and Foundry grades hold their own handsomely, but the supply is relatively larger, so that there is less difficulty in placing orders, although prices are fully maintained. The general outlook appears to be of the most encouraging character, and it is not unlikely that further advances will have to be recorded inside the next 60 days. Meanwhile fair average prices at this writing would be for Philadelphia as follows, and 30¢ @ 50¢ less for deliveries at points within 100 miles south or west:

Standard No. 1 Foundry X.....	\$12.00 to \$12.50
Standard No. 2 Foundry X.....	11.50 to 11.75
No. 2 Plain.....	11.00 to 11.25

In the Chicago market another advance of 50¢ is to be made on Southern Iron to-day. Sales have already been made for future delivery covering a part of this advance, which shows that buyers recognize the upward tendency of the times. The demand for Southern Iron has been fair, although not specially heavy. Several contracts have been taken ranging from 200 to 500 tons. Business in local Coke Iron is much better than in Southern, probably because present prices make local Irons comparatively cheap. Quotations, however, are very firm, and an advance is expected daily. Lake Superior Charcoal is looking up; prices are firm, and orders are being more freely placed. They are still small, however, the largest business of the past week in this line being a contract for 300 tons. Quotations are as follows, for cash:

Lake Superior Charcoal.....	\$13.00 to \$13.50
Local Coke Foundry, No. 1.....	10.50 to 10.75
Local Coke Foundry, No. 2.....	10.25 to 10.50
Local Coke Foundry, No. 3.....	9.75 to 10.25
Local Scotch No. 1.....	10.50 to 11.00
Ohio Strong Softeners, No. 1.....	12.75 to 13.25
Southern Silvery, No. 1.....	12.00 to 12.25
Southern Silvery, No. 2.....	11.75 to 12.00
Southern Coke, No. 2.....	10.50 to 10.75
Southern Coke, No. 3.....	10.25 to 10.50
Southern, No. 1 Soft.....	10.50 to 10.75
Southern, No. 2 Soft.....	10.50 to 10.75

The market for Pig Iron in the Pittsburgh district has been disturbed to some extent by offers of a local interest to sell Forge and Foundry Iron for extended delivery at prices somewhat under the market. For delivery beyond July 1 some furnaces are refusing to quote, while for June delivery prices are ruling as follows, Pittsburgh delivery:

No. 1 Foundry.....	\$11.00 to \$11.25, cash
No. 2 Foundry.....	10.50 to 10.75 "

Activity and strength are the most prominent features of the Cincinnati market for Pig Iron. The sales during the past week have been quite liberal in the aggregate, with a number of round lots that were from 750 to 2000 tons figuring conspicuously among the individual sales. Higher prices are anticipated for Southern Iron, and this may account for the activity among buyers at the moment. It is known that the largest Southern companies have advised agents not to hold open offers longer than 24 hours. The business which has been transacted has been at full basis of values, and when deliveries have extended beyond three months 25¢ per ton additional has been realized. It is noticeable that there is animation throughout the various grades and kinds of Iron, both Northern and Southern make, Forge and Foundry, Coke and Charcoal, for early and late shipment. While the bulk of the Iron sold has been for early delivery—that is, for summer delivery—several transactions have embraced six months, and one sale has been made covering the entire year. Quotations are given as follows:

Southern Coke, No. 1.....	\$10.00 to \$10.25
Southern Coke, No. 2.....	9.50 to 9.75
Southern Coke, No. 3.....	9.00 to 9.25
Southern Coke, No. 1 Soft.....	10.00 to 10.50
Southern Coke, No. 2 Soft.....	9.50 to 9.75
Ohio Soft Stone Coal, No. 1.....	14.50 to 15.00
Ohio Soft Stone Coal, No. 2.....	14.00 to 14.50
Lake Superior Coke, No. 1.....	11.75 to 12.25
Lake Superior Coke, No. 2.....	10.75 to 11.50
Hanging Rock Charcoal, No. 1.....	10.00 to 11.00

Hanging Rock Charcoal No. 2.....	10.50 to 10.75
Hanging Rock Charcoal No. 3.....	10.00 to 9.50
Tennessee Charcoal, No. 1.....	13.00 to 13.50
Tennessee Charcoal, No. 2.....	12.00 to 12.50

The St. Louis Pig Iron market is reported as showing increased strength and sales made during the past week have been at full prices. There is no disposition to shade prices at present prevailing, but on the other hand furnacemen seem more than ever desirous of obtaining current rates and in some cases are asking more money. The consumption of Pig Iron continues to show a steady increase, and it is stated the local users of Iron are melting from 15 to 20 % more Iron than during the month of April. Sales during the week have been satisfactory. We quote as follows for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry.....	\$10.50 to \$10.75
Southern Coke, No. 2 Foundry.....	10.00 to 10.25
Southern Coke, No. 3 Foundry.....	9.75 to 10.00
No. 1 Soft.....	10.00 to 10.25
No. 2 Soft.....	9.75 to 10.00

Metal Market.

Pig Tin.—Prices have continued to steadily decline, and are lower now by 0.30¢ @ 0.35¢ per lb than they were at the date of last week's report. The market has been completely under "bear" control, but operations have been conducted in a manner that prevented panic or anything bordering upon it, although a scarcely interrupted fall of 0.65¢ has taken place during the past three weeks. Considerable Tin has been delivered during the month, but most of the metal represented contract settlements, so that together with the arrivals a liberal stock remains here to work upon. Consumption has been fairly liberal. The price of small lots of Straights Pig from store is quoted at 15½¢ @ 16¢ per lb.

Copper.—Buying has continued fairly, and it is estimated that a business of nearly, if not quite, 1,000,000 lb has been effected. The purchases were for autumn delivery, and the dealings extended over the general line, including Lake Ingot, Electrolytic and Casting stock. Prices advanced further and appear very strong for spot and future deliveries. Appearances are that the market is in good shape. The greater portion of production during the next week has been placed and very little is for speculative account. This and the fact that operations are extending in the autumn months deliveries makes a combination of circumstances that cannot be looked upon otherwise than as reflecting a favorable situation.

No change has taken place in quotations for small parcels of Lake Ingot from store, which rule at 11½¢ per lb. Rumors are afloat in the Copper trade that the Rothschilds have bought the Anaconda mine, the greatest in the world. It has produced 100,000,000 lb in one year and could turn out 50 % more. Rumor has it that the Old Dominion mine in Arizona has also been sold.

Sheet Copper.—A good amount of business is passing in all kinds of manu-

factured copper in this section. Some fairly large orders have been placed during the week by the Cornice trade, and a number of contracts connected with some of the large buildings now in course of erection in this and other Eastern cities are expected to fall in shortly. Inquiry is good, especially for forward delivery, but the manufacturers are not inclined to quote ahead in view of the likelihood of an advance in prices in the early future. Small spot lots of Sheet Copper from store are quoted at the net list price of 14¢ $\frac{1}{2}$ lb.

Pig Lead—The market has been weaker, chiefly under the influence of free offering of Balbach product, delivered, here and in Philadelphia. Common Western eased off under the weight of this pressure, but the amount of sales was moderate. Smaller consumers are buying rather freely and the price for small lots of American Pig from stock is steady and somewhat higher, at 3½¢ @ 3¼¢ $\frac{1}{2}$ lb.

Lead Pipe and Sheet—Business has been somewhat irregular during the week. While the demand for Manufactured Lead is better it still lacks stability, and only a faint disposition is seen on the part of consumers toward buying beyond the measure of current requirements. The outlook, however, for a more liberal scale of business later is regarded as favorable. Many buildings now in hand are not sufficiently advanced to call for their plumbing necessities. These will come into the market in the course of a short time, and should give a good impetus to the trade in Plumbers' Materials, as the amount of building under way and in contemplation in this district is considerable. Prices are firmly maintained at the old list rates heretofore quoted.

Spelter—In this metal there has been a sharp advance. Ordinary Western brands in the wholesale market realized 3.60¢ @ 3.55¢, and offerings at less than 3.70¢ are now moderate. The advance was to very limited offering from primary point. Some firms have withdrawn from the market. Several have sold up their product for the 30 days. Those who offer now ask 3.50¢ in East St. Louis. The current rates for small lots of good Western brands from store has not been changed, but still rules at about 4¢ $\frac{1}{2}$ lb.

Sheet Zinc—Light stocks and a continuance of briskness in the demand keep the price of this material up to the level of last week's advance—namely, 6½¢ $\frac{1}{2}$ lb for 600 lb casks, and 7¢ for smaller quantities from store. The supply of Sheet Zinc in dealers' and jobbers' hands in this section is extremely light, and prompt shipments of any size are almost impossible to be had.

Antimony—Of moderate quantities the movement has been fair, mainly at about 9¢ for Cookson's and 8¢ for Hallett's in small parcels.

Nickel—Sellers' figures remain at 35¢ @ 40¢, according to quantity and terms.

Tin Plate—While the market displays no new features of any importance, business has been very fair, although somewhat uneven. Ordinary Cokes for canners and can makers uses have secured a good amount of attention during the week, and several good contracts for future delivery have been placed at prices which, in some cases, compare favorably with those lately obtainable. American Ternes are moving fairly well,

although the demand from the roofing trade is not yet up to expectations. General buying has been by all accounts well divided between American and foreign stock. Prices in all lines have undergone very little change, but they are rather firmer, with a more cheerful feeling among dealers in regard to the probability of higher rates before very long.

A special London cable dispatch of May 29 to *The Iron Age* reports on the British Tin Plate market as follows: The Tin Plate market has been 'steady. The outlook is better. Fair business in squares and odd sizes. Basometer at 9/8 basis. Better inquiry for Oil sizes. Several works restarting. Good orders at buyers' limits. Prices, f.o.b. Wales, are as follows:

Bessemer Cokes, IC 14 x 20	9/3 @
Siemens Cokes, IC 14 x 20	9/4 1/2 @ 9/8
Ternes, 20 x 28	18/2 @ 22/6
Charcoals, IC 14 x 20	11/ @ 13/6

Sheet Iron—Mills producing Black and Galvanized Sheets are well sold up for 30 and 60 days, and quotations are made for immediate acceptance only. Until the wage scale for sheet mills, which expires on June 30, has been arranged for another year, makers will be very guarded in making contracts for extended delivery. Mills are in many cases absolutely refusing to make quotations, and jobbers experience considerable difficulty in getting orders filled with any regularity. Galvanized Sheets are in very heavy demand, and jobbers' stocks are badly broken. Prices for this material have at last moved up. Small lots of Galvanized Iron from store are quoted by jobbers at 75¢ off, and of No. 27 Common Iron at 2 80¢ $\frac{1}{2}$ lb.

Chicago Report.

Scrap—The demand is growing larger. Dealers quote their buying prices as follows, Chicago delivery:

	Per net ton.	Per lb
No. 1 Wrought Scrap	\$7.50	
Machinery Cast	6.00	
Malleable Cast	6.00	
Stone Plate (free of burnt) ..	4.00	
Burnt Iron and Grate Bars ..	2.50	
Sheet Iron and Hoops	2.00	
Flow Steel and Breaking	3.00	
Stock	2.50	
No. 2, such as Shovels, Hoes, &c	2.50	
Old Boilers—whole (Iron) ..	3.00	
“ (Iron)—cut in single		
Sheets and Rings	5.00	
Old Gas-Pipe and Boiler		
Tubes	5.00	
Cast Borings	3.25

CONDITION OF THE Hardware Trade.

THE SPECIAL FEATURE of the market is the firm tone and upward tendency which characterizes goods which lie near the raw material, owing to the advanced prices ruling for Iron and Metals. Slight advances are thus caused in many heavy goods as well as in those in which Copper is an important material. The consummation of the negotiations between the Wire Nail manufacturers and the reaching of a similar agreement by the Cut Nail manufacturers are important facts, securing material advances in these lines of goods. The fact that increased wages are being paid in many mills and factories is also a significant feature of the situation, and there are indications of labor agitations in other lines, so that it is not improbable that there will be an effort on the part of workmen to secure more or less general advances. The influence of this has not yet been felt to any important degree in General Hardware, and the fact that comparatively few factories are working full time is referred to as bearing against the reasonableness of such demands from the workmen at the present time. While the trade are prompt to recognize the improved feeling and the better prices which characterize many lines, there is a disposition on the part of careful and conservative men to avoid an exaggerated view of the improvement and to see whether or not the present tendency develops into a general advance on the whole line and a material increase in the volume of business. While the announcements of higher prices on heavy goods and such others as have been advanced on account of the increased cost of raw material and perhaps higher wages are excellent indications of an improved condition, it remains to be seen whether or not the trade are going to purchase freely at such advanced prices. With some houses there is certainly a disposition to hold back a little and see whether or not the new prices will be firmly maintained, especially as the next month or two will be likely to try the tone of the market. If during the summer months prices remain steady for such goods, and especially if they have an evident firmness and strength, the trade will regard the outlook for the fall business as exceptionally bright, and in view of all the circumstances merchants generally are taking a very hopeful view of the outlook, and express freely the opinion that the turn has come and that we are on the eve of more prosperous conditions. In most lines of General and Shelf Hardware there has been no improvement in the matter of prices, and it is only in exceptional cases that the manufacturers have been withdrawing some of their extreme quotations. The trade are, however, placing orders much more freely for such goods, the conviction being general that prices are much more likely to advance than to recede further. Manufacturers are in most such lines freely accepting special orders for

early delivery. The fact that throughout the country there is a marked increase in building operations, with the prospect of a good degree of activity in this direction, is very satisfactory, and advices from the retail trade in many sections indicate that there is a perceptible improvement in their current business. This is reflected in the orders which they are sending in with something of the old time freedom to the jobbing houses. The situation is, on the whole, more satisfactory than for a long time and the outlook promising.

Advices from Chicago.—The demand for Shelf Hardware keeps up its volume. One of the local jobbing houses reports that May will be the banner month in their history. The sales of this month in dollars and cents will surpass those of any previous month. This means, in view of the lower prices of goods, a vastly increased quantity of merchandise handled as compared with former years. Seasonable goods are not moving so freely, as the weather recently has been unfavorable. The May trade this year came in April on account of the excessively hot weather at that time. An improvement is perceptible in Builders' Hardware, Tin Plate, &c. The demand for Tin Plate is daily increasing. Manufacturers' agents are in receipt of very large orders, numerous customers increasing their purchases far beyond their usual requirements. Jobbers note the tendency among their customers to place orders for future delivery on such merchandise as Sheet Iron and Steel and other articles which have been prominently affected by the stiffening in raw material. Tinware and House Furnishing Goods are in much better demand than last week.

Notes on Prices.

Wire Nails.—We have to announce the successful consummation of negotiations which have been in progress for several months between the manufacturers of Wire Nails. As a result, the market is in exceptionally good condition and prices are materially higher. A strong organization has been formed, which includes practically all the manufacturers who are actively producing this line of goods, and it is understood that arrangements have been made by which the co-operation of some other concerns is secured, who might otherwise exert a disturbing influence on the market. There are, however, a few matters which at the present time are unsettled, but it is anticipated that these will be satisfactorily adjusted. There is an excellent understanding between the different manufacturers, and all the difficult questions connected with the formation of such an organization, such as the production allotment, schedule of prices, &c., have been satisfactorily settled. The importance of limiting the production of Nails to the requirements of the trade has been recognized, so that the undue accumulation of Nails, by which the stability of the market might be endangered, will be prevented. The estimated demand for each month will be determined by the Executive Committee, by whom also the prices at which Nails are to be sold will be determined month by month. The new arrangement contemplates adequate and reasonable protection for the jobbing trade, through whom the manufacturers expect principally to market the goods. The advance in price is referred to by the manufacturers as required by the increased cost of the raw material and

the upward tendency of wages. It may seem a large advance over the low prices which have recently been ruling, but there is no doubt that such prices were unreasonably low and unprofitable, and it is certainly desirable that the goods should be sold at figures which will yield the manufacturers a reasonable margin.

This arrangement goes into effect with a market that is comparatively bare of goods, the stocks in the hands of the trade being rather light. The jobbers who have goods purchased at lower figures are unquestionably in a position to undersell the manufacturers if they desire to do so, but an excellent opportunity is certainly afforded them to market such stocks and realize a handsome profit. It is too early as yet to announce the prices at which small lots will be sold from store, as the wholesale prices announced do not go into effect until June 1. We are advised, however, that the New England jobbers have determined upon \$1.25 as their price for carload lots at factory and \$1.60 for small lots from store.

Miscellaneous Wire Nails, in papers, have also been advanced, the prices of these goods being determined by the same organization.

Advices from Chicago.—Manufacturers' prices have been advanced to the equivalent of \$1.35, Chicago, for carload lots for delivery up to July 1 only. Buyers who take 1000 kegs for delivery during the month receive a concession of 5 cents. The restriction is made in view of the advancing prices for raw material, which may necessitate another raise during June. Manufacturers state that the advance made is wholly warranted by the circumstances. They had for a long time been actually selling below cost. The advanced price of Wire Rods is now fully \$5 per ton, besides which wages have been raised 10 per cent. in all Wire Nail factories. Large inquiries are in the market for Nails and a good trade seems assured, because stocks in second hands are known to be light. Jobbers' prices were advanced during the week to \$1.35 for small lots. It is expected that within a short time their price will be put at \$1.50 in order to cover the advance made by the manufacturers. The demand for small lots has been very good after each advance, but jobbers have been careful not to take business too freely until manufacturers' prices were finally settled.

Cut Nails.—The Cut Nail market is strong and prices are higher under the agreement made by the manufacturers and the organization which has been formed for the regulation of the market. It is expected that Cut Nails will thus be maintained in price in sympathy with Wire Nails. Prices from store in New York have not yet been determined, the arrangement between the manufacturers going into effect June 1.

Advices from Chicago.—Manufacturers report a continuous increase in business, with orders coming in from unusual sources. Trade has lately been received from localities long occupied exclusively by Wire Nails. Quotations from factory at present are withdrawn, but jobbers have moved their prices upward in anticipation of higher factory prices and are now quoting \$1.25 for small lots from stock.

Barb Wire.—The Barb Wire market continues steady, with something of an upward tendency. The demand is large and there is some delay in filling orders.

Advices from Chicago.—Manufacturers have experienced a very heavy demand since last report. It now looks as if the mills will be able to run steadily through the summer and not shut down on July 1 as usual. The old difference of 35 cents is firmly maintained between Painted and Galvanized, owing to the stiff advance in Spelter. Jobbers quote small lots of Painted at \$1.70 and of Galvanized at \$2.05.

Brass Sheets, Wire, &c.—On account of the higher prices ruling for the raw material an advance of 5 per cent. has been made by the manufacturers of Brass Sheets, Rods and Wire. The market is characterized by a firm tone and an excellent feeling prevails.

Copper Goods.—In sympathy with the improved condition of the Copper market manufactured Copper is held more firmly, and an advance is anticipated before long provided the present tendency of the raw material is maintained. Copper Wire is held at higher prices than a short time ago and the manufacturers are considering the feasibility of another advance in the near future.

Cordage.—The Rope market is firm, with something of an upward tendency, but at the same time is characterized by some irregularity in prices. The quotation of 6½ cents base for Manila represents the price at which large lots are quoted, f.o.b. factory or New York. Sisal is held at 4½ cents, but this figure is sometimes shaded. There is at present practically no market on New Zealand. Jute Rope is quoted at from 4½¢ to 5¢. Cotton Rope is feeling the effect of the advance in raw material, but prices have not advanced in proportion to the higher figures ruling for cotton. The best is selling at 12¢, the medium at 9¢ and common at 7½¢.

Wrought Iron Goods.—There is a better feeling in the market for Wrought Iron Goods, owing to the fact that some of the manufacturers who have been making the cheaper grade and naming very low prices have either practically withdrawn from the market for a time or are refusing to fill orders at their extreme quotations. There is not, however, entire uniformity in the prices at which these goods of the lower grade are selling, but the situation is more satisfactory, with a prospect of still further improvement. No change has been made in the prices of the first quality goods.

Screws.—The manufacturers of Screws report an excellent business and an improved tone in the matter of prices. While there is not entire regularity in the prices at which the different manufacturers are selling, there is a general tendency toward firmness. The trade, recognizing this fact, are purchasing quite freely and the volume of business is good.

Steel Hollow Ware.—There is at the present time an active competition between some of the manufacturers of Steel Hollow Ware. Prices are somewhat irregular and on the whole the market is unsettled.

Nuts, Washers, &c.—While there has been no formal advance in these lines some at least of the manufacturers have withdrawn extreme prices and the market is in a little better condition. It is, however, conceded that the present prices are so low that the continued improvement in the iron market, espe-

cially if complicated with labor agitations, will be likely to result in higher prices.

Nestable Strainer Pails.—A description of these Pails, which are manufactured by Sidney Shepard & Co., Buffalo, N. Y., was given in *The Metal Worker* of the 18th inst. These Pails are sold from the following list, which is subject to a discount of 60 per cent. to the trade:

	Per dozen.
12 quart	\$13.00
14-quart	14.25

Glass.—The productive capacity of Glass factories shows a gradual decrease, the pots or their equivalent now in operation being 1234, or about one-half of the number of pots in the United States. Prices are being maintained as a general rule and factories report a fair demand. It is understood that the National Plate Glass Jobbers' Association recently held a meeting in Chicago, and agreed to a discount of 60 and 10 per cent. up to 10 square feet, and 60 and 20 per cent. discount above 10 square feet. Stock is being reduced by a larger demand and the shut down of the factories.

Old Metals.—The demand for this class of material is fairly active. Scrap Iron in particular exhibits a brisk movement, with some scarcity of material in certain lines. Prices on small lots have not, however, been advanced by dealers. The following quotations represent the prices now being paid for lots of this character by dealers, New York delivery:

Heavy Copper.....	lb 73¢
Light and Tinned Copper.....	lb 74¢
Heavy Brass.....	lb 5¢
Light Brass.....	lb 4¢
Lead.....	lb 28¢
Tea Lead.....	lb 24¢
Zinc.....	lb 24¢
No. 1 Pewter.....	lb 9½¢
No. 2 Pewter.....	lb 4½¢
Wrought Scrap Iron, gross	
ton.....	\$7.50 @ \$8.00
Heavy Cast Scrap.....	gross
ton.....	7.50 @ 8.00
Stove Plate Scrap.....	gross ton 5.00
Burnt Iron.....	gross ton 3.50

Old Rags, Paper, &c.—The market shows no change from last week. Business is fairly active, and prices remain substantially the same for all lines of Paper Stock. Dealers' purchasing prices, New York delivery, rule as follows:

No. 1 White Rags.....	lb 3	@ 3½¢
No. 2 White Rags.....	lb 2½	@ 2½¢
Mixed Rags.....	lb ¼	@ 1¢
Blues and Sds.....	lb 1	@ 1½¢
Hard Sized White Shavings.....	lb 2½	@ 2½¢
No. 1 White Book Shavings.....	lb 1½	@ 2½¢
No. 2 White Book Shavings.....	lb 1	@ 1½¢
Light Book Shavings.....	lb 1	@ ½¢
No. 1 Mixed Shavings.....	lb ½	@ 1¢
No. 2 Mixed Shavings.....	lb ½	@ ¾¢
No. 1 Printed Books.....	lb 1	@ 1½¢
Ordinary Mixed Books.....	lb 1	@ 1½¢
Newspapers.....	lb ½	@ 3½¢
No. 1 Manila Paper.....	lb ½	@ 1¢
No. 2 Manila Paper.....	lb ½	@ ¾¢
Bogus Paper.....	lb ½	@ ¾¢
Common Paper.....	lb ¼	@ ¾¢
Straw Chips.....	lb ¼	@ ¾¢
Binders' Clippings.....	lb 1	@ 1½¢
Fate Butts.....	lb 1½	@ 1½¢
No. 1 Jute Bagging.....	lb 1	@ 1½¢
Mixed Bagging.....	lb ½	@ 1¢
No. 2 Bagging.....	lb ½	@ ¾¢
Hemp Twine.....	lb 2	@ 2½¢
Manila Rope.....	lb 2	@ 2½¢
Jute Rope.....	lb 1½	@ 1½¢
Mixed Rope.....	lb ½	@ ¾¢

Old Rubber.—The following quotations represent about the current prices paid by New York dealers:

Car Springs, ton lots, gross	3	@ 3½¢
Rubber Shoes, carloads, delivered at factory, gross	4½¢	
Rubber Shoes, less than carloads, gross	4½¢	
White Wringer Rolls, gross	3½¢	
White Syringes, gross	3½¢	

Trade Notes.

THE FRECKINRIDGE TIN CAN COMPANY, Toledo, Ohio, with a capacity of 40,000 cans daily, are running their factory full for 24 hours a day in order to meet the recent heavy increase in orders from the canning trade. The company are already some 30,000 gross behind their orders, and have been, in consequence, compelled to refuse to enter into any large contracts for early delivery at present.

THE WHITING FOUNDRY EQUIPMENT COMPANY of Chicago recently shipped to Cuba one of their No. 1 Whiting cupolas complete with 40 foot stack. They have also an order for car wheel foundry equipment for a Brazilian firm.

THE ZIMMER MFG. COMPANY of Chicago, Ill., have been granted license to incorporate, with a capital stock of \$6000, the incorporators being M. C. Rasmussen, Charles F. L. McKinley and J. H. Breckenridge. The new company will manufacture hydrants.

Legislation on Unsanitary Buildings.

An important clause, embodied in the new law recently passed by the State Legislature of New York and approved by Governor Morton, relates to the condemnation of unsanitary buildings in New York City. The clause, which is based upon English legislation and experience, was suggested by the special Tenement House Committee, appointed by the Governor a year ago. It reads as follows: "Whenever in the opinion of the Board of Health of the Health Department of the city of New York, any building or part thereof in the city of New York, an order to vacate which has been made by said board, is, by reason of age, defects in drainage, plumbing, infection with contagious disease, or ventilation, or because of the existence of a nuisance on the premises, which is likely to cause sickness among its occupants, or among the occupants of other property in the city of New York, or because it stops ventilation in other buildings, or otherwise makes or conduces to make other buildings adjacent to the same unfit for human habitation, or dangerous or injurious to health, or because it prevents proper measures from being carried into effect for remedying any nuisance injurious to health or other sanitary evils in respect of such other buildings, so unfit for human habitation that the evils in or caused by said building cannot be remedied by repairs or in any other way except by the destruction of said building, or of a portion of the same, said Board of Health may condemn the same and order it removed, provided the owner or owners of said building can demand a survey of said building in the manner provided for in case of unsafe buildings, and may institute proceedings in the Supreme Court, in the County of New York, for the condemnation of said building. Said proceedings shall be instituted and carried on in the manner prescribed by the Code of Civil Procedure, except as modified by this act. Upon the institution of said proceedings the owner of said building, or any person interested therein, may in his answer dispute the necessity of the destruction of said building or part thereof as the case may be. In such case the court shall not appoint commissioners unless proof is made of the necessity of said destruction."

June Conventions.

Our readers will be interested in the several conventions of trade associations which meet during the month of June. A quarterly meeting of the Central Supply Association will be held at Detroit on June 11 and 12. During this same week the convention of the National Association of Master Plumbers and of the Master Steam and Hot Water Fitters' Association of the United States will be held at Philadelphia. While these conventions are in session members of the American Society of Heating and Ventilating Engineers are invited to an informal meeting at the Continental Hotel. Immediately following these conventions, it is reported that a meeting of the Association of House Heating Boiler Manufacturers will be held at Geneva, N. Y., on June 30. During the week of the conventions in Philadelphia the Pennsylvania master steam fitters will hold a meeting at the Continental Hotel, to form a State Association of Master Steam Fitters. The plumbers of New Jersey are invited to meet at the Continental Hotel on the 12th inst., for the purpose of forming a State Association of Master Plumbers.

The Debs Decision.

The recent ruling of the Supreme Court of the United States, whereby it sustained the action of the lower court in passing sentences of imprisonment on Eugene V. Debs and his official associates of the American Railway Union, for their action in the Pullman trouble of last summer, is very important in its effect upon the operations of labor organizations. The offense for which Debs and his coadjutors suffer was the ordering of a general strike of the members of the union. The Supreme Court holds that this proceeding was a violation of the law, being designed to cause a willful obstruction of interstate commerce. Such obstruction is regarded as a public nuisance, to

be suppressed like any other nuisance. Just as the courts have jurisdiction over a private nuisance, affecting the individual, so, as in the present case, they are empowered to act where the nuisance affects the people at large. "It surely cannot be seriously contended," the Court says, "that the Court has jurisdiction to enjoin the obstruction of a highway by one person, but that its jurisdiction ceases when the obstruction is by a hundred persons." The effect of this ruling is to practically deny the right—which has been hitherto generally conceded—of labor organizations to make even peaceful efforts to inaugurate a strike which would involve interference with the operation of a railroad. Such action, the Court decides, constitutes a public nuisance affecting the people at large, and, therefore, organized bodies of workmen can be legally enjoined from efforts to bring such an event to pass.

The Macy Manual Arts Building.

A few weeks ago the Macy Manual Arts Building of the Teachers' College, this city, was formally opened for the first time to the public, giving an excellent opportunity of observing the benefits derived from a course of study pursued at this institution. The building is 147 feet long, 71 feet wide, five stories and basement in height and equipped with all the appliances necessary for the purpose. In the basement is the Department of Elementary Metal Working, including the foundry and forge, adjoining which is the polishing room, where the final touches are given to the pieces turned out. Four rooms are devoted to metal working, chipping and filing, soldering, molding, casting and forging. On the first floor are offices, conference rooms, library, lecture room, machine tool room and wood turning room. The second floor is occupied by the Department of Elementary Manual Training, in which the rudiments of designing and color working are taught; the Architectural Department; the joining room for cabinet making and carpentering, and the wood carving room. The third floor is devoted to the Department of Mechanical Drawing, Clay Modeling, &c.; the fourth floor to the Museum and Art Department, and the fifth floor to the lecture room. At the formal opening of the building the teachers and pupils gave exhibitions of wood carving, joining, turned wood work, iron work, clay modelling, mechanical and architectural drawing, charcoal and pen and ink sketching, color work and needle work. The school will be open to receive pupils in September next, and

will be under the direction of a committee of the Teachers' College faculty, consisting of the Board of Directors of the Manual Training and Art Education. The aim is first to train teachers and supervisors of manual training and art students, and second to give instruction in manual training and art work to students pursuing courses in other departments of the college, to special students and to pupils in the Horace Mann School, the latter being the academic part of the college.

Improvement in business is a mockery to salesmen whose services are dispensed with because no more orders can be taken for an indefinite time. This fate has suddenly overtaken men in various branches of trade. For the past two or three years they have been working perhaps more diligently than ever, and at reduced salaries, because orders were so hard to get. No one longed for an improvement in business more fervently than they. The better demand finally came, but in a deluge and not in a gentle, kindly, invigorating series of showers, and it has flooded them out of employment.

In the current number of the *North American Review* Mr. Mulhall, the English statistician, furnishes some interesting statistics in regard to the wealth and resources of the United States. He points out, by careful comparison between the different conditions in different countries, that an ordinary farm hand in the United States raises as much grain as three in England, four in France, five in Germany, or six in Austria. One man in America, he states, will produce as much flour as will feed 250 people, whereas in Europe one man on an average can feed only 30 persons. He shows also how the intellectual power of the people of this country has kept pace with its industrial and mechanical progress, 87 per cent. of the total population over ten years of age being able to read and write.

The Pennsylvania Railroad will shortly carry out a series of tests of considerable interest in respect of the comparative efficiency and economy of steam and electricity as a motive power in railway service. For this purpose the company have selected the Mount Holly Branch of the Camden & Burlington Railroad, extending from Camden to Burlington, N. J., a distance of seven miles. The equipment of this line as a trolley road has been in progress for some months past. As at present operated by steam the line is a source of greater expense than of gain to the company. If it is found that expenses can be reduced by the adoption of electricity on this line, it is likely that the trolley will supersede steam on a number of other small branches owned by the company in different parts of the system.

THE LETTER BOX.

Economizing Chimney Heat.

From W. W., *Freeland, Pa.*—I would like to have a little information with reference to a chimney which a customer of mine wishes to have put up in a building four stories high. He intends to use 7-inch wrought iron pipe, and run it through the center of a 30-gallon boiler on each floor, so that the heat which is ordinarily lost in the chimney can be utilized for heating water. After passing through the boiler on the highest floor the chimney will continue on through the roof.

Note.—We shall be glad to have our readers discuss this chimney problem. It would seem that a 7-inch smoke stack is rather small, for we suppose that there will be fittings introduced into the wrought iron pipe so that the stoves on each floor may be connected into it. The strength of the draft or the rapidity with which the smoke passes through the chimney depends largely on temperature, and if this is reduced to too great an extent the smoke will fail to rise and pass out of the chimney. The effect of incasing the pipe with a cylinder filled with cold water will be to reduce the temperature of the products of combustion very materially. We do not know of a case where such an experiment has been tried. Boilers are often set vertically in an ordinary brick chimney, and located so that the pipe hole in the chimney through which the hot smoke from the stove enters is directly below the boiler and the smoke must pass up alongside of it. In such cases the heat from one stove, as run in the average kitchen, will heat the water to a temperature suitable for the majority of household purposes. From this it seems probable that there will be sufficient heat to raise the water to a satisfactory temperature in an apparatus similar to that proposed; but it is hardly likely that a 7-inch pipe will be large enough for the work. Larger pipe would give better satisfaction, providing the expense of the proposed arrangement does not prohibit its use.

Sheet Zinc for Eave Troughs and Conductors.

From N. K. W., *Stoneboro, Pa.*—Will the Letter Box readers give their views regarding the use of sheet zinc as a material for eave troughs and conductors. During an experience of over thirty years I never saw or heard of a job where sheet zinc had been used for outside work until I came to this place. One job is said to be of zinc, and has been in use about eight years. As I have not examined it I am unable to report regarding its condition. On account of the sulphur in the soot from the coal used here, tin spouting will not last over two years, and it is said that galvanized iron is but little better. I would like to get the experience of the craft generally regarding the matter.

Show-window Fountain.

From J. W. S., *Wascoutah, Ill.*—I would like to see published in the columns of *The Metal Worker* illustrations and description of a show window fountain. I think it would interest many others as well as myself.

Answer.—In the first place we will describe a fountain invented by Hero of Alexandria, who lived about 250 B. C. In Fig. 1 is shown a sectional view

Fig. 1.—Sectional View of Hero's Fountain.

the top, as shown. The tube F is provided with a cork or stopper, and leads from the bottom of the open dish or pan at the top to the tank A. The stopper having been taken out of this tube the tank A is partly filled with water. The stopper is then replaced, and the open dish at the top is nearly filled with water. As the water passes through the tube C into the tank B the air is expelled and passes up the

Fig. 2.—Broken View of Fountain in Sheet Metal with a Portion of the Exterior Broken Away.

of the fountain, while Fig. 2 represents a broken view of the same device, and indicates the construction in such a way as to enable those of our readers who desire to make one. The apparatus consists of an open dish and the two closed tanks A and B, arranged as shown in Fig. 1. The open dish placed at the top communicates with the lower part of the tank B by means of the tube C. Another tube, D, leads from the top of tank B to the upper part of tank A. The discharging tube passes through the open pan at the top to the lower part of the tank A. The discharging tube is made tapering at

tube D into tank A. The air, being compressed in tank A, presses on the water and forces it out through the jet. This operation is continuous until the water in tank A is exhausted. The water in tank B can be drawn out at G, and the open dish or pan at the top and the tank A are again filled. It will be understood that the operation of the fountain depends upon the height of the column of water in the tube C of Fig. 1.

In a previous issue of *The Metal Worker* we presented a description, with engravings, of a fountain contributed by George H. Lee of Exeter,

Neb., and which is as follows: "I send you diagrams of a tin fountain which I recently made, and which is exceedingly simple in construction. B and C, Fig. 3, are two cans, the bodies of which are formed from a sheet of 20 x 28 roofing tin cut in two pieces, 10 x 28 inches. H H, F F, G G are tin tubes formed on gutter beader and soldered perfectly tight. A is a common 12-inch wash basin, a 2-inch hole in the bottom, under which is soldered a 1½-inch can screw top, N. The overflow tube H extends through a hole in can screw under basin, through can B to within ¼ inch of the bottom of can C. Tube F extends from within ¼ inch of the top of can B to ¼ inch through can

when it can be drawn off at J and the operation repeated. A nozzle may be made from a hollow nickel stove knob and the small can screw punctured at top with a very small hole. The fountain will throw a stream 12 inches high for about six hours, and with the basin filled with rocks and moss, and surrounded with plants, produces a pleasing effect."

Trouble with Galvanized Iron.

From W. A. S., Kentucky.—For the past twelve years we have been making galvanized iron tanks for water coolers, and never before have we had any trouble with water tasting from being in them. This year, however, we are using some 24-gauge galva-

examined the tank and found such to be the case, and in less than eight months after it was in it was literally eaten up with rust. The same range had already been in use fourteen years, and had been supplied with a galvanized tank at the time it was put in use, made from No. 18 gauge, and galvanized after it was made. This tank lasted fourteen years, and when it was worn out was not in as bad condition as ours was after it had been in use six months. We wrote the manufacturer to know if he could furnish another galvanized tank as good as the one on the range when put in and he replied in the negative. Our foreman seems to think that the first tank was made out of the best bloom charcoal iron, and the second, made out of the so-called best bloom charcoal iron, was in reality made from soft steel, which accounts for its rusting out so soon. We know that ordinary galvanized iron tea kettles, galvanized after being made, and made of pretty heavy material, will not last any time. Can you explain why the first tank lasted so well and why galvanized iron will not last at all when used with hot water, though it is durable when used with cold water?

Casting Statuettes.

From J. R. H., Hazelton, Pa.—I would like to get information on two important points in casting soft metal statuettes. I am at the present time using lead, tin and antimony, and I have trouble in getting the alloy to flow through the brass molds easily and fill them up. One of the figures I am casting chokes up, and I probably have to pour ten to get one good one. I have difficulty in making the figures to a certain degree flexible enough to be bent without breaking and yet stiff. The next thing I want is to be able to give the figures a beautiful bright gold color that will not readily fade or tarnish and that cannot easily be rubbed off. I wish to do this in the easiest way and hope to accomplish it by the immersion process—that is, to dip the figure in a solution without the use of a battery.

Extending A Heating System.

From TRANSPILATED, New York.—The readers of *The Metal Worker* will doubtless be interested in the changes

Fig. 3.—Sectional View of Fountain as Made by Mr. Lee.

screw K. Tube G extends from within ¼ inch of bottom of can B through can screw N, ending with a nozzle even with top of basin. L is an inch tube fitted with small can top for filling can B. Can screws must be washed with leather and all seams and joints made air tight. M is a circular top with a wired tin rim 1 inch high and serves as a flower stand. The diagram shows form of legs, of which there are three, and method by which they hold cans B and C firmly in place. They are fastened to top M by screws, and at the bottom by three braces, I. To operate, fill can B partly with water through tube L, then screw top L on tight and fill basin with water, which, passing through tube H, forces air through tube F to top of can B, and the pressure thus obtained forces the water from can B through tube G, forming a tiny fountain. This continues until the water is all in can C,

Fig. 4.—Perspective View of Fountain Shown in Previous Figure.

nized iron manufactured by a prominent maker, and with ordinary fresh water in it it seems to continue to corrode, and when water is drawn which has been in it over night small particles of oxide of zinc are seen on the surface of the water. We have some tanks in our store that have been in constant use for eight years and they do not show any signs of corrosion or rust even now. Can you explain this matter? Is there any material out of which tanks can be made that has the objectionable features of the zinc covering eliminated? Some years ago we used kalamine iron, but it seems to rust. Have you any suggestions to offer? The tanks are made in such a shape that they cannot very well be enameled. We would also call attention to another experience we had. About a year ago we were asked to make an open galvanized iron tank to be attached to a range in one of the large hotels here. Our workmen used 16-gauge, best bloom galvanized iron and galvanized the rivets and seams inside and out. Within six months the party we made it for called and said that holes had rusted in it. We

Extending a Heating System.

which we made in the heating system which was extended by the country plumber and shown in *The Metal Worker* of May 25. We made alterations in the job, as shown in the sketch, after which it worked properly.

Greenhouse Heating.

From F. M. P., New Jersey.—Will some of the practical readers of *The Metal Worker* please give me some information on heating small greenhouses with hot water? I am not seeking for the scientific frills, but information which tells simply and plainly what size pipe and how much should be used, also the kind of pipe and the size of the boiler that would be required.

thus obtained trace the curve as shown. Then the curve thus determined will represent the required section and will give the stretchout of the envelope. On the line R P, produced sufficiently outside of the side view for the purpose, lay off the stretchout of one-half of this curve, as shown, and from the points thus established draw measuring lines parallel to D F. Then, with the T square placed parallel to P R, or, what is the same, at right angles to D F, and brought successively against the points in the profile of the can body

Annual Exhibition at the Pratt Institute.

The doors of the Pratt Institute, Ryerson street near DeKalb avenue, Brooklyn, were opened to a throng of interested visitors on Thursday and Friday afternoons and evenings and Saturday afternoon, May 23-25, giving an opportunity to examine the work of the pupils in the different departments. The buildings of the institute are in the form of a hollow square, covering fully half a block, some of the buildings being six stories high and with a light and well ventilated basement. The

cupola and melting the iron to making the cores and preparing both bench and floor molds for the castings, then pouring the castings. The work shown, which was made by the students, was of a highly creditable character.

The plumbing shop is equipped for 50 pupils, and instructors Todd and Heath have sent many well qualified young plumbers to the various shops in the vicinity. In connection with the carpentry branch, a full and complete course in architectural drawing is given; so that a young architect, in addition to being qualified for building a pair of stairs and framing a many gabled roof, is instructed in perspective and the other requirements of architectural designing which will enable him to plan a building that will harmonize with the surroundings in which it is erected.

In the manual training school some elemental instruction is given in sheet metal work, and the array of coffee pots, miniature dish pans, tin cups, tin elbows, dripping pans and tin pails testify to the expertness of the pupils. In the department of sheet metal pattern cutting, which was instituted last year, an exhibition is made of some articles the patterns for which show that the pupils have thoroughly mastered the art of developing the surface of irregularly shaped objects. It was noticeable that a large proportion of the visitors have been women, some young, and by their enthusiasm they show that they are graduates of the school and that they are as eager to have visitors examine the mechanical departments of the school as they were the departments devoted to household science. The different shops were in charge of young men who have had instruction in them, as the questions asked by their guests could only have been answered by those who had mastered the course of the department.

A feature of the Industrial Exposition which will be held in the city of Berlin next year is a separate pavilion, covering about 1200 square yards of ground, which will be especially attractive to those who are interested in the study of modern city improvements. Here will be shown the details of the management of educational, hospital and benevolent institutions. An exhibit will also be made of sewerage, gas and water systems, as well as of bridges, markets and public baths. These will be illustrated by models and drawings, as well as by original objects so far as possible.

Plans and specifications for the erection of buildings in New York City since the beginning of the year indicate a marked revival of activity in the building industries, also a largely increased investment of capital in improvements to real estate. The number of plans and specifications filed in the Building Department in the first quarter of 1893 was 655; in the first quarter of 1894, 538, while in the first quarter of the present year the number filed was 1107, or only 86 less than the total for the same period in the two previous years. The cost of buildings proposed to be erected in the first quarter of 1893 was \$14,897,638; in the first quarter of 1894 it was \$9,418,930, making a total for the two quarters of \$24,298,568. Contrasted with these figures the cost of the buildings proposed to be erected in the first quarter of 1895 was \$27,462,514, or over \$3,000,000 more than the aggregate of the first quarters of 1893 and 1894.

Pattern for a Can Boss to Fit Around a Faucet.

between D and A, cut the measuring lines of corresponding numbers. In like manner bring the T-square against the points in the top of the article shown from F to C, and cut the measuring lines of corresponding numbers. Then lines traced through the points thus obtained, as shown by D' A' and F' C', will be one-half of the pattern of one of the ends. As that portion of the boss lying between points A, B and C is simply a flat triangular piece it is only necessary to add a duplicate of its shape to that part of the pattern just obtained, bringing one of its straight sides against the line 5, all as shown. To the other straight side C' B' must be added a duplicate of the first part of the pattern reversed, as shown by B' C' G' E'; the resulting shape will then constitute the pattern of one-half the boss.

majority of the visitors took the elevator immediately to the sixth floor, to the department of domestic science, which gives instruction in chemical work, so that the character of the food may be analyzed by the students, as well as the process of putting the different materials together and producing food of a character approved by the most modern cooks and epicures. One of the special features of this course which will be interesting to our readers is the lectures on household sanitation, which include selection and location for a house, its surroundings and cellar, removal of waste, plumbing and care of fixtures, the water supply, ventilation, heating and lighting, sanitary furnishing, and the general care of the house. A chart, showing the modern plumbing system, with baths, water closets, urinals, laundry tubs and sinks, is used in connection with the lectures, so that the young women have a comprehensive idea of what is required in a correct plumbing system.

Drawing, painting in both water colors and oil, sculpture and designing are taught in different departments. In the manual training school department a physical laboratory occupies a large space in the building. Here chemistry as applied to the various arts is acquired by the pupils. In the mechanical drafting rooms steam engineering, strength of materials and mathematics pertaining to mechanical engineering are taught. The electrical laboratory is specially well equipped, and the different branches of electrical work are taught in the simplest forms from the first principles. In connection with these departments there is a well equipped machine shop, foundry, blacksmith shop, carpenter shop and plumbing shop, so that the student in taking a course receives instruction in all these different branches. Students become familiar with the operation of a lathe, milling machine and the different tools of a machine shop, and afterward go through the foundry, from charging the

STEAM AND HOT WATER.

The Steam Fitters' Convention.

The outlook for a large attendance at the convention of the Master Steam and Hot Water Fitters' Association of the United States at Philadelphia next week is brightened every day by additions to the membership. Recently applications from isolated steam fitters have been more than plentiful, and the delegates who report that they will be present from some of the old local associations are several times the number that have been sent to former conventions. The energy of those in the management of the association has aroused an interest which will show in nearly three times the membership at the next convention that were in good standing at the last convention. The report of the Executive Committee will be a résumé of the work of the past year. The secretary's report will treat largely of statistics which reflect greatly to the credit of the association. The president's address, in addition to alluding to the information contained in these reports, will make some recommendations as to the future course of the association. It is probable that the Executive Committee will have a conference with the Executive Committee of the National Association of Master Plumbers at their session in Philadelphia next Monday afternoon.

The Hercules Seamless Copper Ball Float.

The illustration herewith shows the Hercules seamless copper ball float, which is manufactured by the Union Brass & Metal Mfg. Company, St. Paul, Minn. By a patented process they are enabled to produce hollow copper ware without seams, and of a quality that is said to be superior to hard rolled copper, being perfectly even and homo-

The Hercules Seamless Copper Ball Float.

geneous throughout, without flaws, and absolutely impervious to water. These floats are made to stand a very high working pressure, from 200 to 1000 pounds to the square inch, and each one, it is claimed, is thoroughly tested before leaving the factory. The company agree to replace any of their floats which either fill or collapse under a pressure of 300 pounds to the square

inch for a period of one year from the day of shipment. They are said to be specially adapted to the requirements of all builders and users of hydraulic machinery for use in connection with steam traps, receivers and other steam and hydraulic devices.

The Gurney Bright Idea Water Tube Heater.

The trade will be interested in the accompanying broken view of the Bright Idea water tube heater just brought out

poses of cleaning, while the surface being directly above the fire the movement of the heat products, it is stated, is so rapid when the dampers are opened that the surfaces are almost if not quite self cleaning. It is pointed out that by the use of a series of webs cast upon each side of the heating surface deflecting flues have been formed, one near the top of the boiler at the back and another at the front near the center. These plates keep the fire from pursuing a direct line from the grate to the exit flue, so that the products of combustion are brought into direct contact with a

The Gurney Bright Idea Water Tube Heater.—Broken View, Showing Internal Construction.

by the Gurney Heater Mfg. Company, 163 Franklin street, Boston, Mass. As shown, it is a square fire box boiler and presents a large surface in transverse waterways. The joints are made by means of screwed nipples, outside of the fire lines, while the front and back sections are made in single cored castings and the center section made in halves nipped to the drums. This arrangement is particularly alluded to, as it enables repairs to be readily made without disturbing any part of the boiler except that which it is necessary to move. The grate supplied with the heater is of the finger bar rocking and dumping type, which permits any grate bar to be removed and replaced through the fire door. The fire box is large and the surface above it may be reached from either the front or rear for pur-

large number of water tube surfaces, more or less staggered, until the gases reach the last series but one, where they are compelled to pass to the front of the boiler into the flue mentioned, and thence along parallel lines between other water surfaces until they finally reach the smoke pipe. The object of the manufacturers was to provide a simple, efficient and economical boiler without return flues, and at the same time furnish the apparatus at a reasonable cost. Almost any kind of fuel of a good quality can, it is claimed, be used in these boilers, which are convertible and can be employed for either steam or hot water heating. The Gurney Heater Mfg. Company have published new catalogues which fully illustrate this new line of boiler, which will be sent on applica-

"Light, Heat and Power for 23 Cents a Day."

A visit to B. H. Hilliar, New London, Conn., will show that a portion of his store back of the office bears a resemblance to a machine shop, while the front shows a well kept line of stoves and ranges and house furnishing articles. Inquiry as to the use of the power plant and its connections discovered the fact, tersely put, that they represent "light, heat and power for 23 cents a day." An upright boiler is conveniently located and connected with a small engine. By running the boiler at a little higher pressure than would be needed for heating the store and shop, power is secured for running a lathe and a Jarecki pipe threading and cutting machine and for running a grindstone, an emery wheel and a mill in the shop. When none of these tools is in use the engine is connected with an electric dynamo, generating electricity, which is stored in a storage battery and used for lighting the store and shop in the evening. A sufficient quantity of soft coal to run the apparatus for one day costs but 23 cents; and when the engine is in use exhaust steam is employed for heating. The apparatus is kept in good order and runs noiselessly, so that it is an attraction rather than a disadvantage in the showroom. The showroom is 17 x 90 feet. With the assistance of the heat thrown off by the boiler, a radiator, exposing 120 square feet of surface, located in the office, provides all the heat that has been found necessary in the showroom. In the workshop radiator coils are arranged under the work benches and heat it satisfactorily. These coils contain 130 square feet of heating surface. The steam pipes running to the radiator in the store and to the coils in the shop are both $1\frac{1}{4}$ inch, the return pipes being slightly smaller. A line of shafting runs along the ceiling of the store and workshop, with pulleys attached for running the belts to the different tools. This apparatus has been in use two winters, and has not ex-

A. B. Franklin and J. A. Ingalls, trustees, and C. F. Whittemore, J. C. Hunnemann and A. B. Sanborn, Investigating Committee.

Anti-Waste Expansion Tank.

The illustration herewith shows a new expansion tank recently put on the market by Hepe, Koven & Co., 18

Anti-Waste Expansion Tank.

Spruce street, New York, which they call the Anti-Waste. The tank is made of refined iron, galvanized, and has a ball cock attachment and removable cover. The ball cock is placed in the tank so as to close when the tank is one-third full of water, allowing two-thirds of the capacity of the tank for the expansion of the water in the heating system when it becomes heated. An overflow is placed in the tank near the top. The cover is made so that it

HEATING NOTES.

Those who have not already arranged for space for exhibits at the conventions next week should make their application to Wm. H. Doyle, 221 South Sixteenth street, Philadelphia, who has charge of the allotment of space.

ARTICLES OF INCORPORATION have been filed by the Webster City Hot Water Heating Company, Webster City, Ia., with \$50,000 capital, of which \$21,000 must be paid up. The directors are: L. S. Bunker, president; James Shepard, manager. The business is manufacturing hot water heating apparatus.

THE EUREKA HEATING & VENTILATING COMPANY, Saginaw, Mich., have leased the Union block on Tilden street, and are fitting it up in connection with their office and showroom in the Bancroft block.

BROOMELL, SCHMIDT & Co., York, Pa., announce that they will be represented at the conventions to be held in Philadelphia next week, and hope to be able to meet their many friends for the purpose of explaining to them the details of their new Sun steam heating boilers. H. H. Lindemuth, who is well known in the trade, will be at the Continental Hotel during the full term of the conventions.

ONE of the neatest advertising souvenirs that have come to our notice is a card issued by the Carlon Furnace Company of Utica, N. Y. It is of heavy pasteboard, with serrated edge, and at the side is a little thermometer with a special cardboard backing, fastened to the main card. The advertising matter is the simple mention by name of hot water and steam boilers and combination heaters and hot air furnaces, together with a broken view of the Carlon water boiler, while below are a couple of brief references to a test conducted by William J. Baldwin, which showed that the evaporation was 11.2 pounds per pound of combustible and the added statement by Mr. Baldwin that the

"Light, Heat and Power for 23 Cents a Day."

ceeded "23 cents a day for light, heat and power." With Mr. Hilliar's permission, we have made this sketch and description of the plant, which will doubtless be interesting to many of our readers.

THE SIXTH ANNUAL MEETING of the Massachusetts Steam & Hot Water Association was held at the American House, Boston, last week. P. H. Kendrick presided. The following officers were elected: P. H. Kendrick, president; John F. Bjerkel, vice president; F. W. Foster, secretary; A. H. Kenrick, treasurer; A. C. Walworth,

can be removed, being fastened by means of thumb screw clamps which catch under a ring riveted to the shell on the inside of the tank near the top. The ball cock used is capable of standing a pressure, it is claimed, as high as 300 pounds. This tank insures the system of piping and radiators being kept full of water, for as soon as the ball cock falls water will flow in from the supply pipe. Thus the water line in the system is always kept at a safe level without attention. The tank is made in 11 different sizes, varying from 12 x 22 inches to 27 x 60 inches, and with capacity of 10 gallons to 150 gallons.

boiler was shown to utilize all of the available heat of the fuel. The souvenir, if we may so call it, is a particularly neat one, and, entirely apart from the worth of the goods it celebrates, its intrinsic value is sufficient to insure its preservation.

BROOMELL, SCHMIDT & Co., LIMITED, York, Pa., are issuing a catalogue entitled "Our Own Radiator Valves." The front and back cover and the first inside cover contain an exact reprint of the labels used on the boxes in which they are packed. These show a steam and hot water radiator valve and a radiator union elbow. The valves have

Jenkins disks for steam, quick action gates for water, and Broomell's improved studded wheels. The cover is printed in red and black, and the text is printed in red and black on blue paper, showily setting forth the features of the valves. A complete price-list is also given.

THOMAS W. RUSSELL, 2449 North Twenty eighth street, Philadelphia, Pa., has invented an incubator for which he claims special advantages. Before putting it on the market he wishes to hear from manufacturers of small hot water heaters and expansion tank, the heaters to use coal oil lamps,

in such a position that their proper relations to each other are readily seen. It also shows the grate and fire pot sections and the arrangement of the indirect smoke passage in the upper section. The last page shows an engraving of the check draft which is used on the rear of this heater.

LOCKWOOD & ADAMS have just completed the arrangement of their new quarters at 143 Centre street, New York. The walls and ceiling have been painted pure white and the front portion of the room has been covered with linoleum, while that portion which is devoted to the display of radiators is

boiler in aluminum bronze and gilt, and several styles of radiators differently ornamented. At his shop at the present time he is making two notable coils of pipe. One is made from extra heavy $2\frac{1}{2}$ inch pipe, using 130 feet in a coil that is 23 inches in diameter and stands 9 feet high. The other is made from 4 inch pipe, and is a circle 30 feet in diameter.

THE ARMSTRONG MFG. COMPANY, 139 Centre street, New York, are placing on all their new pipe cutting and threading machines an automatic attachment for feeding the pipe cutter. This device is so arranged that after the

Fig. 1.—Outside View of Portable Hot Water Heater.

Fig. 2.—Portable Steam Boiler with Front Plate Removed.

THE HERSEY HEATING BOILERS.

gasoline burners or gas jets. He also wants prices on iron pipes, valves, &c.

JAS. T. MURRAY, Hartford, Conn., has leased the heating department of the Bosworth Heating and Supply Company, and the latter company will now devote their entire attention to the jobbing of heating and plumbing supplies. Mr. Murray has just taken the contract for the heating of Mrs. Hastings' new house with a Boynton hot water heater.

THE H. B. SMITH COMPANY of Westfield, Mass., and 133-137 Centre street, New York, are issuing a four-page circular of their Cottage hot water heater. On the front page a very pretty half-tone engraving is shown of the Cottage heater. On the second page the rating and dimensions are given. The third page shows the different sections of the heater suspended one above the other

covered with a rich crimson carpet. Here are arranged the various styles and sizes of both the Exeter and Napoleon radiators for steam and hot water. The radiators are handsomely decorated with different colors of bronze and enamel, some in plain colors and some having the relief portions decorated with bronze of different shades, making a very pretty effect.

RICHARD D. JACKSON, JR., 89 Centre street, New York, has recently been rearranging his sample room, erecting a platform on which is arranged samples of the hot water and steam boiler which he handles freshly painted and decorated with gilt bands.

GEORGE FRANKLIN, 142 Centre street, New York, has caught the Centre street spirit of decorative radiator and boiler display, and in front of his building is showing a Mahony steam and hot water

pipe is cut off it will automatically throw off the stop, should the machine be left without attention, and thus prevent breakage. They are also preparing for the market a new bench machine for cutting pipe up to 3 inches in diameter and a new power machine for cutting 8-inch pipe.

D. R. MCCALLUM has left the office at 69 Centre street, New York, in charge of George W. Plastow while he is making a visit to the office of the J. H. McLain Company, Canton, Ohio. He will return in time to meet the steam fitters at the Philadelphia convention.

PRESIDENT W. A. M. GRIER of the Corry Radiator Company, Corry, Pa., is located in a new office at 101 Beekman street, and is prepared to talk Corry radiation, inviting the heating trade to call on him. He has recently received

orders for three carloads of radiators from Francis Bros. & Jellett, the heating engineers and contractors of 1914 Arch street, Philadelphia.

THE NIAGARA RADIATOR COMPANY, 89 Centre street, New York, have recently shipped to the order of the Wells & Newton Company their new indirect radiators for use in the \$60,000 residence which is being erected by Dr. Warner.

F. D. JOHNSON, formerly superintendent for Russel Wheeler & Son, Uica, N. Y., has connected himself with the Hersey-Atwood Heater Company of Clifton, N. J., and will look after their interests in steam and hot water heating.

THE AMERICAN BOILER COMPANY, 94 Centre street, New York, and 84 Lake street, Chicago, have just brought out three catalogues. One refers to

THE GENERAL HEATING COMPANY have been incorporated at Philadelphia, for manufacturing heaters and heating appliances, with a capital stock of \$50,000. The directors are James Brown, Henry G. Morris and Pedro G. Salvin.

The Hersey Heating Boilers.

The accompanying illustrations show a new type of steam and hot water boiler for hard or soft coal, invented and patented by George H. Hersey and manufactured by the Hersey-Atwood Heater Company, whose office and works are located at Clifton, N. J., the company having just been incorporated, with a paid up capital stock of \$50,000. Among the several improvements which the manufacturers claim for the invention is the fact that the sections are connected together by R. & L. nipples, making an iron to iron joint. The

square feet of direct steam radiation and from 450 square feet to 6500 square feet direct hot water radiation. The three smallest sizes are made in portable form, shown in Figs. 1 and 2, incased in asbestos lined galvanized iron casings. The larger boilers are set in brick work, as in Fig. 3. Each boiler is provided with a deflecting plate, so that the products of combustion are prevented from passing directly out of the smoke pipe collar, if so desired. The circulation of water within the heater is all vertical, and the claim is made that it is the only cast iron sectional steam boiler that will hold a steady water line under all pressures. The vertical waterways allow the heated water or steam to rise into the flow headers with a minimum of friction and without being deflected through horizontal channels. The freedom of internal circulation allows of a perfect equilibrium

Fig. 3.—Brick Set Hot Water Heater.

the Florida steam boiler, another to the Perfect hot water heater, and the third to the Soliel safety steam boiler. The Florida catalogue treats first of the magazine top for hard coal, giving sectional illustrations to show the internal construction, also illustrations of heavy duty or double boilers, which are followed by a full description of the new Florida surface burner, for all kinds of coal, which was recently shown in these columns. The Perfect catalogue, in a similar manner, treats of the special points of the Perfect hot water heater, showing by sectional illustrations the great quantity of heating surface exposed and setting forth other special merits of the heater. The Soliel catalogue is a concise statement of the manner in which the Soliel boiler is constructed, yet all the parts are fully shown, and the inquiring steam fitter is thoroughly informed as to its special advantages. All these catalogues are attractively gotten up, well printed, handsomely illustrated and neatly bound in colored paper covers.

sections are all made up in the factory and before shipment are tested to 60-pound cold water pressure, when they are ready to be set in position on base of heater. The method of connecting the cast loops together allows of a very great amount of boiler surface being used, every particle of which, it is claimed, comes in direct action with the fire, the spaces between the loops being only sufficiently large to allow of the thorough cleaning of every part of the loops. After the sections are placed on the base the feed and return headers are quickly and thoroughly made up by the use of flanged T's, as shown in the cuts. The use of these flanged T's does away entirely with the use of the old style method of connecting by means of a nipple made up with running thread and lock nut, the use of which, the manufacturers say, means an assurance of leaking joints and labor lost. The Hersey boiler is made in 13 distinct and separate sizes, each for steam and hot water, carrying from 300 square feet to 4000

being maintained, and, it is claimed, does away entirely with the backing of water into the radiators. The boiler surface is all fire box surface, which the flame and intensely heated gases are compelled to pass over in their natural travel to the chimney. The grates used on the portable boilers are of the triangular revolving pattern, those used on the larger being a special pattern constructed by Mr. Hersey, and each boiler is fitted with a slicing door, through which the whole surface of the grate can be reached with a slicing bar, preventing the formation of clinkers. A special feature on the smaller heaters is the use of soapstone in the rear and front of fire box instead of fire brick.

The Hersey boiler is made of low height, the portable form being only 56 inches high and the brick set form 60 inches; they are, therefore, specially adapted to low cellars. The inventor of this boiler has had a great deal of experience in steam and hot water boiler construction, being the inventor of a number of the best known and most suc-

cessful boilers on the market at the present time. Catalogues and price-lists of these boilers can be obtained by sending to the Hersey-Atwood Heater Company.

THE SAMUEL JACKSON COMPANY, Pawtucket, R. I., have purchased from the assignee of the Union Steam & Gas Pipe Company, through an arrangement with their creditors, all the stock and accounts of the late company, and are now ready to take orders and give estimates for all kinds of work done by the old company. Particular attention will be paid to all kinds of house heating apparatus, and a line of furnaces and steam and hot water heaters will be carried.

Boiler Maker's Bending Rolls.

The accompanying cut illustrates improved bending rolls put on the market by Bertsch & Co., Cambridge City, Ind., and which are described as automatic opening, closing and self-adjusting. The opening of the rolls, it

after bending a plate unless the plate to be formed is much thicker or thinner, in which case the lower roll is adjusted at both ends by wedges. The back roll, which is the main bending roll, can be quickly adjusted at either one or both ends, the adjusting screws being provided with a link belt chain attachment. The back roll is also arranged for adjusting by belt power. All the shafts, pins and screws are made of steel and have, it is said, large bearings, with extra strong pinions and gearing throughout. These rolls, which are 10 feet long, are adapted for bending plates from $\frac{1}{2}$ to $\frac{3}{4}$ inches thick.

New York's Big Schemes.

New York now has on hand three schemes of great importance and vast magnitude, which will call for the expenditure of over \$100,000,000. All are designed to facilitate traffic, one being confined wholly within the city limits, while the other two are intended for travel entering and leaving the city. One aims to relieve the crowded parts by bringing a portion of Brook-

will place it easily at the head of all kindred structures. It will serve to emphasize the remark of the late M. de Lesseps when, upon being shown some of the works in this country, he said: "The American engineers are very audacious." Incidentally the construction of this bridge will settle, probably for all time, any prospect of the completion of the Hudson River Tunnel, and in that we shall have the failure of a useful and grand conception.

The third scheme, the plans for rapid transit, is the most unsatisfactory one of all, and also the mostly costly. There is a prejudice against a tunnel as a passageway for constant daily travel. Public sentiment seems to be that it should not be adopted except where it is the only method possible. Further, engineers of experience are doubtful if the tunnel could be built without seriously damaging adjoining foundations. Again, the present plans do not provide rapid transit for a very large portion of the city north of the Harlem River. After having spent the \$55,000,000 now available, further extensions will be demanded in order to furnish the relief needed and to cover

Boiler Makers' Bending Rolls.

said, is accomplished in 5 or 10 seconds, according to the size of the machine, by simply disengaging the journal bearing buckle, which when thus removed and turned back will elevate and support the top roll and at the same time lower the opposite end of the bottom feed roll sufficiently to release a formed plate of extreme width which is to be removed. This is automatically accomplished by an attached horizontal forged steel lever beneath, which is operated by a lug or cam on the bearing buckle. This lever is also properly connected to the opposite ends of the top and bottom feed rolls, as shown in the illustration. The lower roll's adjustable bearing box at the opposite end is supported by a vertical fulcrum post, P, which rests firmly on top of the horizontal lever in the rear of the fulcrum pin F. The lower roll, it is pointed out, is therefore free to be raised or lowered at the opposite end automatically in conjunction with the top roll, so the top roll need not be elevated much to open the roll to free the formed metal the entire length, and the weight of the lower roll becomes an element in raising and supporting the top roll when opened to remove the plate. The bearing buckle being thus balanced the roll is easily opened and closed, and by a slight turn of the lock screw in the center of the buckle the machine is again ready for operation. As the lower roll is thus self adjusting it need not be readjusted each time

lyn within easy reach: another will make a common terminus in the business heart of the city by bringing all the great railroad systems now ending at Jersey City over the Hudson River; the third is expected to draw the northern sections nearer the down town region by furnishing quick and convenient lines. We refer to the proposed bridge across the East River, the Hudson River bridge and the rapid transit plans.

The first will open a large part of Brooklyn not now accessible because of inadequate and slow means of communication. If we may judge of the ultimate success of this plan by comparison with the present bridge, the relief afforded will pay a grand return upon the cost of the improvement. The bridge will reduce the congested condition of New York and be of direct financial benefit to Brooklyn by making new sections desirable.

Now having their termini on the west bank of the Hudson are the West Shore, Delaware, Lackawanna & Western, Erie, Pennsylvania, Lehigh Valley and Jersey Central railroads, all of which will be enabled to use the contemplated bridge. The delay caused by the present methods of moving freight across the river will be obliterated and several hours, on the average, will be gained thereby. Both passengers and freight will be landed in New York on time and with the greatest possible expedition. As an engineering work this bridge will stand without a rival; its magnificent dimensions and boldness of design

the entire territory it is desirable to cover. In this case the question of cost is of minor importance provided the lines constructed serve perfectly the ends in view. If we are correct in this assumption—and the Brooklyn Bridge shows the increased land values in Brooklyn—then the statement is also true that it is unwise to build a railroad under ground when it is possible to erect it above the surface.

A purchase of pig iron, remarkable on account of its purpose rather than for its extent, was recently ordered by the Board of Prison Inspectors of Lancaster County, Pennsylvania. It appears that Lancaster County has been for long a favorite resort for tramps, and this class of vagrants has been hitherto too well cared for even in jail. To put an end to the nuisance the prison keeper at Lancaster has been ordered to purchase 2 tons of pig iron, and every tramp committed for a longer period than 24 hours will be compelled to take five hours' active exercise carrying this iron from one end of the prison yard to the other. All refusing to do so will be put upon half rations.

On account of trolley competition it is announced that the Pennsylvania Railroad is about to make a general reduction in local passenger rates.

Chili has concluded a loan of \$10,000,000 with the Rothschilds.

TIN PLATES.

SCRAP.

THE MARYLAND STEEL COMPANY of Sparrow's Point, Md., are building the new tin plate plant for the Stickney Iron Company of Baltimore.

BEFORE a select committee, appointed by the British House of Commons to inquire into the question of distress and want of employment, Secretary Phillips of the Welsh Tin Plate Workers' Union gave a series of figures to show the widespread nature of the distress among the tin plate workmen of South Wales. Mr. Phillips estimated the number totally idle as 6500, while a few short of 6000 were partially idle, making a total of 12,500, against 13,000 in full work. These figures, which were compiled from the books of the union, relate principally to men, but include a few women and children.

GEORGE J. HUMBERT of Norristown, Pa., advises us that, in conjunction with New York and Pittsburgh capitalists, he is about to erect a complete four mill modern tin plate works at Connellsville, Pa.

THE AMERICAN TIN PLATE COMPANY, Elwood, Ind., are proceeding rapidly on the new addition, to accommodate five new mills which they propose adding to their plant.

THE TIN MILLS of both the La Belle Iron Works, Wheeling, W. Va., and the Laughlin Iron & Nail Works, Martin's Ferry, Ohio, are expected to be put in operation next week, giving employment to several hundred men in the Wheeling district. The black sheet mills of both plants are reported to have sufficient work in hand to keep them busy for the next three months.

THE CLAYTON TIN PLATE WORKS, Pontardulais, South Wales, have been started into operation under an agreement with the workmen, who accept 12½ per cent. reduction in wages for the month of June. All the other tin plate works at Pontardulais—namely, those of the Csmbria Tin Plate Company, Tello Tin Plate Company and the Gismorgan and Hendy works of Webb, Shakespeare & Williams, are reported idle.

THE LANDORE TIN PLATE WORKS, Swansea, South Wales, which have been working very irregularly for the past four years and have been shut down for some months past, were recently restarted on the men accepting a larger reduction than 12½ per cent. in their wages. This action on the part of the Landore workmen appears to have raised a considerable amount of ill feeling among the tin plate men in other places.

"OPEN DOORS" is the title of the latest advertisement issued by N. & G. Taylor Company, tin plate manufacturers, of Philadelphia. The present circular consists of a folder, the front of which represents the doors of a factory which open in the center, displaying to view a half-tone picture of the interior of the company's tin house, showing the workmen, tinning stacks,

tin racks, dusting boxes, &c. On the face of the circular is a large red hand, the index finger of which points to the tinning stacks at the right foreground of the picture. By the side of the hand an announcement is made that in these stacks is made the Genuine Taylor Old Style brand of roofing plates. Attention is particularly called to the fact that there is no shafting, machinery or rolls, and that the work at these stacks is done entirely by hand, the same as in 1830. In this attractive little circular an invitation is given to all the friends of the firm to visit their works. The company claim that, as there are no secrets in making the best goods, so they are not afraid of the whole trade knowing by what processes their special brands are manufactured.

SOME of the heavy machinery for the new tin plate plant of the Laughlin Nail Company, at Martin's Ferry, Ohio, has been received and the work of erection will commence at an early date. The foundations for the engine and the roll trains have been completed, and the excavating for foundations for another engine and train is nearly completed. This will be one of the largest tin plate plants in the country, and the contract for its entire construction was secured by the Totten & Hogg Iron & Steel Foundry Company of Pittsburgh.

ON MONDAY, MAY 27, operations were commenced at the new tin plate plant of the Crescent Tin Plate Company, Cleveland, Ohio. The plant consists of four hot mills and four cold mills. The building containing the four hot mills is 105 x 175 feet, and the building containing the four cold mills is 105 x 168 feet, with a wing 48 x 48 feet. In the former is a 12-ton electric crane and the annealing house contains a 6 ton crane. The tinning house contains ten stacks, with pickling machines and other equipment. The black plate mills were put in operation, and as soon as a supply of black plates have been secured the other departments of the plant will be started up.

WILLIAM GRIFFIN of Pittsburgh, Pa., who was one of the first in this country to enter the tin plate business, will shortly commence the erection of a new plant at North Washington, Pa. The plant will cost \$150,000 and will employ about 300 hands.

SOME IMPROVEMENTS are about to be made to the tin plate works of the St. Louis Stamping Company, St. Louis, Mo.

THE WORKS of the Ellwood Tin Plate Company, Ellwood City, Pa., are rushed with orders and a number of new men have been recently put on.

RECENT ADVICES from San Francisco, Cal., state that imports of tin plates at that port have been large. The steamer "Ainsdale," from Liverpool, brought to hand last week 32,896 boxes, making a total importation of 199,635 boxes since January 1. The market is said to be firm and stocks only moderate. The consumption of tin plates on the Pacific Coast this year is expected to be exceptionally large. Pig tin, in

that section, has taken a considerable move upward in price, stock on hand having been encroached on considerably by the demand of canners and others and there having been no recent arrivals of the metal.

THE TIN PLATE WORKS of the Meurer Brothers Mfg. Company, 575-577 Flushing avenue, Brooklyn, are kept busy on orders for the special Meurer brands of roofing plates. The concern are now turning out an average of 2000 boxes weekly, all six tinning sets being kept in steady operation during the day. The demand for the American roofing plates manufactured by this firm is so satisfactory that they are able to keep little or no stock, the plates being shipped to fill orders as quickly as they are made. It is possible that the works may have to be put on double turn before long should the present growing demand continue. The Messrs. Meurer have lately placed in their tin house a suction fan, designed by Jacob Meurer, the head of the firm, which has been found very effective in securing proper ventilation.

ALLERTON-CLARKE COMPANY have moved their Western office in Chicago from 23 to 118 Lake street, where, among other interests, they will represent the Allerton-Clarke Mfg. Company, manufacturers of tin andterne plates at Anderson, Ind.

THE UPPER FOREST TIN PLATE WORKS of Wm. Williams & Co., Swansea, and the Clifflaw Works, Neath, South Wales, have recently started into partial operation.

A DECIDED INCREASE in the demand for palm oil for tin plate manufacturers' purposes is reported by Robert Crooks & Co., 138 Front street, New York. The firm make a specialty of supplying the trade with a high grade clarified palm oil named Fancy Lagos, which they claim gives the best results in connection with tin plate manufacture.

AT THE OFFICE of Goldsmith & Loewenberg, Temple Court Building, New York, are displayed some very excellent samples of high grade bright coke andterne plates and black steel plates now being manufactured at the new plant of the Pennsylvania Tin Plate Company, New Kensington, Pa. These specimens of American plates have been submitted to a number of tin plate experts, who have pronounced them fully equal in finish to any imported plates of their kind. The plant of the Pennsylvania Tin Plate Company has been in full and successful operation for the past two weeks with four hot and four cold mills and seven tinning sets. The company have started in with a large number of orders on their books. The officers of the concern are Philip Goldsmith, president; Berthold Goldsmith, vice-president, and J. L. Goldsmith, secretary and treasurer.

A larger number of new industrial enterprises were organized in the South last week than in any one week for years.

ROOFING AND CORNICE.

Extreme Temperatures.

BY A BLISTERED TINNER.

I read a good deal about temperatures in the steam and hot water department of *The Metal Worker*, and find quite a little about extremes of temperature; but I am disposed to think that, though I am a tinner, all are not as thoroughly acquainted with the extremes of temperature as I am. In proof of this I will attempt to give a convincing illustration to those who more frequently than the tinner talk of the extremes of temperature. I am constrained to do this by reason of the recent hot spell in May, which brings vividly to my mind an experience of May, 1881. I had done enough tin roofing previous to that time to be acquainted with the high extreme, for I have worked on tin roofs when a thermometer lying flat on the roof in the sun at midday would register 122 degrees, and when hung up on the nail keg in which we kept charcoal and cleats, the reflection of the sun would raise the temperature up to 128.

The experience of a bygone May is rather peculiar. I was out of work at the time and looking for something more remunerative and refreshing than roofing, but a friend who was in the roofing business was blessed by having all the buildings for which he had contracted to do the roofing get ready for the roof at the same time. He had all of his available force engaged and was threatened with the loss of one large contract at a profitable figure unless he put men to work the next day. I was inveigled into taking hold of this particular job with the promise that he would get me help, but as the outlook for the canning season was good every available tinner or man who had experience in helping at tinsmithing was employed in the canning houses except one darkey who agreed to work. The first day we were at work the thermometer was reported to be 97, and we gradually reduced our clothing to the requirements. The second day clothing consisted of a light shirt, a pair of overalls and a pair of heavy shoes, as the thermometer got up to 98. The morning of the third day was sultry, and although the thermometer registered but 97 at noon the heat was more oppressive, and after dinner I decided that as the building was out in the suburbs I would do without the shirt. The darkey had his African blood up and said if I could stand the sun he could and doffed his shirt too. We got all the tin on the roof that afternoon and the next morning it was necessary to go to the shop to get some tools and the coppers for finishing. On arriving at the shop at about 6:30 the good lady who took a lively interest in the institution called me to her and gave me a resounding smack on the back, asking me if it hurt. I told her that it did not, and then she invited me into the shop to see the darkey, who was lying on the bench with his back covered with cold cream, giving a polish to a series of blisters. I was

surprised to find the darkey so thoroughly used up while I was still in good condition to finish the roof, which I did alone.

Now, this represents the high temperature. The low temperature is recalled by an experience of a different character. This was another emergency case. A contractor for a row of buildings could not get one of his payments unless the heating flues were placed in position in the building, and, as a matter of course, these had to be commenced in the cellar. All of this work had been gotten ready in the shop, and I was sent to put it in place, with instructions to begin at the cellar. The weather previous to this journey had been ordinarily cold for a few days, but on the morning in question it had dropped down to zero. When I got to the cellar I found that there was about 4 feet of water in the cellar and a coating of ice over the top of it. At first I thought that this would make the job impossible, but on second thought I

Corrugated Iron Tables.

The Columbia Corrugating Mfg. Company, formerly the Chicago Steel & Iron Roofing Company, 16 and 18 West Lake street, Chicago, and Niles, Ohio, have had specially prepared for their recently issued catalogue two tables for users of corrugated iron in which the trade will be much interested. We are indebted to the courtesy of the Columbia Corrugating Mfg. Company for permission to reprint the tables with the accompanying explanations and examples:

Table No. 1 shows the number of sheets required to cover a square 10 x 10 feet, the number of square feet each sheet will lay, the number of sheets in a square, counting outside or surface measure, or counting actual laid surface, including side lap and end laps, from 0 to 6 inches inclusive, and for all lengths of sheets from 30 inches to 120 inches. All sheets lay 24 inches to centers, with one corrugation for side lap.

Table No. 1.

Length of Sheets.	Outside or surface measure.		2 and 2½, with side lap.							
	2 & 2½ inches corrugation.	1½ inches corrugation.	End lap.	End lap.	End lap.	End lap.	End lap.	End lap.	End lap.	
	26 inches wide.	25 inches wide.	None.	1 in.	1½ in.	2 in.	3 in	4½ in.	6 in	
30 inches.....	5 5⁄8	5 5⁄8	5	4 3⁄8	4 3⁄8	4 2⁄3	4 1⁄8	4 1⁄8	4	
32 inches.....	18 1⁄8	19 1⁄8	20	20 3⁄8	21 1⁄8	21 1⁄8	23 1⁄8	23 1⁄8	25	
36 inches.....	17 1⁄8	18 1⁄8	18 3⁄4	19 1⁄8	19 1⁄8	20	20 3⁄8	21 1⁄8	22 3⁄8	
48 inches.....	15 1⁄8	16 1⁄8	16 3⁄4	17 1⁄8	17 1⁄8	17 1⁄8	18 1⁄8	19 1⁄8	20	
60 inches.....	11 1⁄8	12 1⁄8	12 1⁄2	12 3⁄8	12 3⁄8	13 1⁄8	13 1⁄8	13 3⁄8	14 3⁄8	
72 inches.....	10 1⁄8	10 1⁄8	10	10 3⁄8	10 3⁄8	10 3⁄8	10 3⁄8	10 3⁄8	9 1⁄8	
84 inches.....	9 1⁄8	9 1⁄8	9	9 3⁄8	9 3⁄8	9 3⁄8	9 3⁄8	9 3⁄8	8 3⁄8	
96 inches.....	8 1⁄8	8 1⁄8	8	8 3⁄8	8 3⁄8	8 3⁄8	8 3⁄8	8 3⁄8	7 3⁄8	
108 inches.....	7 1⁄8	7 1⁄8	7	7 3⁄8	7 3⁄8	7 3⁄8	7 3⁄8	7 3⁄8	6 3⁄8	
120 inches.....	6 1⁄8	6 1⁄8	6	6 3⁄8	6 3⁄8	6 3⁄8	6 3⁄8	6 3⁄8	5 3⁄8	

found it would make an admirable scaffold. I commenced operations by the aid of this natural scaffold, and although the work was not agreeable at the low temperature, I was making fair progress when the ice broke and I went through. I do not think that I need continue any further to satisfy my friends in the steam and hot water trade that the tinner is thoroughly acquainted with high and low temperatures.

FITZ, DANA & Co., Boston, Mass., call attention to their supplies for tinsmiths, roofers, plumbers, blacksmiths, and metal workers generally, by means of small blotting pads, on the back of which is an announcement with a calendar for the month of June.

In the above table the upper figures show how many square feet there are in each sheet, and the lower figures show how many sheets there are per square. Below is an example of the application of Table No. 1.

Example.—Suppose a surface of 1242 square feet is to be covered with corrugated iron, with 84 inch iron, 3 inch end lap, and with one corrugation for side lap.

In columns opposite 84 inch and under 3 inch, take the number 13½ and divide 1242 by it; thus:

$$\begin{array}{r} 13\frac{1}{2} \overline{)1242} \\ \underline{92} \end{array}$$

therefore 92 sheets would be required.

Or take 1242 square feet and multiply by 7½, the number of sheets per

square given in same column, and divide by 100.

Rule.—Divide the square feet to be covered by the upper figures, or multiply by the lower figures, to ascertain the number of sheets required.

Table No. 2 shows the percentum increase from surface measure to surface laid. Its use is for determining the number of sheets required for any surface, including side lap of one corrugation and end laps, 0 inch to 6 inches.

metal partitions, doors and shutters, which are fully illustrated and explained.

Yates' Patent Gutter Clamp.

We show in the accompanying illustration a clamp for use in soldering eave troughs that is being manufactured and put on the market by Yates Patent Clamp Company, Muskogee, Indian Territory. The use of this device is said

around chimneys, skylights and fire walls, and heating supplies.

Empire Ventilator.

The illustration herewith shows the Empire ventilator, manufactured by H. Doerge, 556 Eleventh avenue, New York. It is made of galvanized iron, being constructed to operate with very little friction and so as not to be likely to have its operation stopped by corrosion. It is said to be especially effective in connection with smoky and faulty chimneys. For use with sani-

Empire Ventilator.

tary systems in connection with air vents of the soil pipes which pass through the roof it is said to have excellent advantages. Wind pressure tends to draw the air from the chimney up through the ventilator. It is designed to shed water. It is made in several different sizes, and ventilators of large dimensions can be manufactured to order.

FLASHINGS.

AMONG THE CONTRACTS recently taken by F. H. Sneath, the slate and tile roofer, of Farmington, Conn., are the following: At the Sessions Foundry Company's new plant, in Bristol, office building, 5000 feet No. 1 Brownville slate; power house and addition to foundry, 9600 feet Vermont slate; storehouse for

to economize labor very largely, and with it any person who can solder at all can make a perfect gutter equal to the work of the best. The construction of the clamp is clearly shown in the engraving, and sheet metal workers will readily understand its application and see

Yates' Patent Gutter Clamp.

how it is that so much time is saved by its employment.

"ST. LOUIS UP TO DATE" is the title of a handsome volume of 240 pages which reaches us with the compliments of the Stockhoff Heating Supplies Company, 407-409 North Twelfth street, St. Louis, Mo. The volume, as its title indicates, presents a brief history of the city of St. Louis as well as of concerns engaged in its leading industries. Among the latter is the concern above named, who handle the Bostwick steel lath, Tuttle & Bailey registers and ventilators, the American Seal builders' and roofers' elastic oil cement, designed for repairing leaks

the Atwater Mfg. Company, Plantsville, 143 x 52 feet, with No. 1 Brownville slate; storehouse for the Hartford Rubber Works, Hartford, 102 x 48 feet, sea green slate; addition to Hartford Cycle Company Works, Hartford, 50 x 12 feet, sea green slate, and a number of smaller jobs. Although Mr. Sneath is very busy his facilities are such that he is able to take care of a vast amount of work.

JAMES E. KELLEY, New Haven, Conn., has finished the roofing of the big power house of the electric railroad in South Norwalk. He also has the contract for roofing the new Nihill Block and P. & F. Corbin's big factories in New Britain.

Below is an example of the application of Table No. 2 :

Example.—Taking the same conditions as in Table No. 1, in a surface of 1242 square feet covered with corrugated iron 84 inches long, 3 inches end lap and 1 corrugation side lap, the percentum increase is 12.3%. Therefore, 1242 square feet plus 12.3% per cent, equals 1396 square feet. Divide this gross quantity by 15½, the number of square feet in each sheet, and we have:

$$\frac{15\frac{1}{2} \times 1396}{92}$$

that is, 92 sheets.

Rule.—To the net surface add the percentum increase caused by the end and side lap, and divide by the square feet in each sheet.

CATALOGUE No. 9, issued by the Kinnear & Gager Company, Columbus, Ohio, is a handsome publication, showing a line of sheet metal work. It is an oblong volume, tied together in portfolio form and having on the front cover in raised fancy gilt letters the title "Interior Decorations." These interior decorations consist of fine stamped sheet metal work in many beautiful designs. Half-tone engravings show some 22 different styles of ceilings, and then follow a number of center pieces of various ornamentation. Later on many other panels, borders, moldings, scrolls, &c., are shown in half-tone engravings illustrating the beauty of the work. The remaining illustrations in the pamphlet are likewise given up to sheet metal ceilings, beam coverings, cornices, &c. Special attention is directed to their rolling

THE RETAIL STORE.

Angle Lamp.

The Angle Lamp Company, 76 Park place, New York, are offering the Angle lamp as here shown. It is constructed somewhat on the principle of the student lamp, the fount supplying automatically a proper and sufficient quantity of oil, which cannot get below a certain point, insuring a flame of even brilliancy until all is exhausted. The burner is almost horizontal, the light

There are a number of styles made in tin blued, brass and nickel plated and polished brass.

The Lincoln Latch Lock.

The Miller Lock Company of Philadelphia, Pa., have lately brought out and placed on the market a new 4-inch latch lock or night latch known as the Lincoln, a general view of which is pre-

are German silver and will not rust; the keys are reversible, thus avoiding any fumbling in the dark, while a one-

The Lincoln Latch Lock.—Fig. 1.—General View of the Lock.

eighth turn of the wrist is all that is needed to open the latch. The device is also of such a size that only a $\frac{1}{4}$ -inch

Fig. 1.—Sectional View of Angle Lamp.

casting no under [shadow]. The arrangement of the globe and burner is said to produce a steady white light, almost perfect combustion and freedom from odor. The mechanism of the burner is designed to prevent the accumulation of gases and resultant explosions. Fig. 1 illustrates the interior construction of the lamp and essee with which the wick is lighted without

sented in Fig. 1 of the cuts, while in Fig. 2 are shown the bronze metal escutcheon and key. The lock is referred to by the makers as possessing a number of points of excellence and superiority, brief mention of a few of which may prove of interest to the trade. The device has a reversible bolt of bronze metal adapted to doors which open inward as well as those

Fig. 2.—The Bronze Metal Escutcheon and Key.

hole is necessary to be cut in the door. Another point with regard to the keys

Fig. 3.—Double Burner Side Wall Lamp No. 253.

Fig. 4.—Three-Burner Swinging Frame Lamp No. 302.

removing the globe. Figs. 2, 3 and 4 illustrate several types in single, double and triple burners for side walls or suspension from the ceiling. The lamps are made regularly with as many as four burners, although any number to 12 inclusive can be put on one chandelier when specially ordered.

which open outward. The latch lock is adjustable to all doors from $\frac{1}{2}$ inch to 2 inches in thickness, while another size lock is made to fit doors from $1\frac{1}{4}$ inches to 3 inches in thickness. Each latch has for its exposure a bronze metal escutcheon, while the finish of the latch itself is strictly first class. The springs

is that they will not interchange even in large sets, unless made alike to order. The manufacturers of the Lincoln latch publish an illustrated catalogue showing some of the many goods which they manufacture, and we understand that a copy of the publication will be sent to any one applying for it.

The Champion Steel Range.

The range which is made under the above name by the Champion Steel Range Company of 35 West Center street, Cleveland, Ohio, embodies a number of interesting features of construction. The accompanying engraving gives a general idea of the arrangement of the various parts, together with the course of the air currents and the products of combustion. The outside casing of the stove consists of two thicknesses of heavy cold rolled steel lined with asbestos and thoroughly riveted together. The fire box is lined with 2-inch fire brick and fitted with duplex grate. The oven is so braced that warping is said to be impossible, and all parts of it are subjected to a uniform heat, thus economizing in the use of fuel. The oven door opens down, forming a shelf which is flush with the bottom of the oven. The door is so balanced inside that it can be opened and shut with ease, while the latch is closed by a spring. The elevated closet is 17½ inches above the top surface of the range, so that a large wash boiler can be placed under it without interfering or necessitating the removing of the cover. The closet is provided with two swingselves, thus giving, it is claimed, double the usual amount of available space for warming plates or keeping cooked dishes warm. In the illustration which we present the figures 3 and 3 indicate the springs to the hot closet door, which is made of one piece, the

manufactured by Keen & Hagerty of Baltimore, Md., being in charge of this branch of their house.

Sanitary Garbage Can.

Sidney Shepard & Co., Buffalo, N. Y., are introducing the sanitary garbage can herewith shown. The can disinfects automatically from the cover, the disinfectant being poured into the cover from the bottom, and when the cover is placed on the can the disinfectant commences to drip. It is explained that any disinfectant may be used; that

Sanitary Garbage Can.

It does not spill when the cover is removed; that one filling lasts a long time, and that the disinfectant may be used at a cost of 5 cents a month or less. The can is designed to keep garbage sweet and to prevent fever germs, foul odors, sour cans, poisoned air and the spreading of disease by flies. The manufacturers state that the device sells at a small advance over the ordinary can.

Stove and Hardware Dealers of Kingston, N. Y., and Vicinity.

BY HENDRICK.

Eight miles north of Kingston, on the line of the New York, Buffalo & West Shore Railroad, lies the village of Saugerties. It is here that James Russell carries on the hardware and stove business which he bought from S. G. Searing in the year 1884, it having been established before the Civil War. Mr. Russell carries a full line of shelf ware, tin and wooden ware, agricultural implements and lamp goods, and does an extensive business in plumbing and tinning in all their branches. He makes a specialty of the Sunshine ranges and stoves made by the Reading Stove Works, and has built up a good business in them. His store is attractively arranged, the first floor being given up to hardware and agricultural implements, while the second is devoted almost exclusively to the stove business. The plumbing and tinning departments are located in a separate building at the rear.

A few doors to the left of the village square is the stove and hardware store of H. C. Hildebrand, who carries a stock of general hardware, cutlery, agricultural implements, stoves, ranges, &c. His leading lines of stoves are the

Andes, made by the Phillips & Clark Stove Company; the Aladdin, made by Burdett, Smith & Co., and the Manhattan, made by Eugene Munsell & Co. The store is so arranged that the stove department occupies one side, while the hardware, in boxes with samples exposed, occupies the entire left side. Mr. Hildebrand started in business in a small way some eight years ago, and has built up a good trade among his many friends in the village and throughout the rural districts. He recently purchased the building which he now occupies, and is assisted in the plumbing and tinning departments by his sons.

Daniel T. Lamb has been in business in Saugerties since 1867, and is one of the old settlers in the tin and hardware line. He learned his trade in a shop on Fulton street, near Broadway, New York City, at the time when Trinity Church was building. He recalls with pleasure how he used to watch the then high steeple growing higher and higher as the work of construction progressed. Mr. Lamb sells as his leading line the Red Cross stoves and ranges, made by the Rochester Co-operative Foundry Company, and does a general plumbing and tinning business. He carries a complete assortment of hardware, tinware and agricultural implements.

G. Deterick does a tinning and jobbing business, selling the Hudson line of stoves as well as the Cable ranges, made by E. B. Colby & Co. Mr. Deterick has been in business for several years and has built up a gratifying trade.

At Rosendale, where the manufacture of the celebrated Rosendale cement is the chief industry, Graham & Longyear carry on the business of stoves and hardware, giving attention to plumbing and tinning in all branches. The leading lines of stoves are the Andes, made by the Phillips & Clark Stove Company; the Aladdin, made by Burdett, Smith & Co., and the Glenwood, made by the Weir Stove Company. Mr. Longyear, the junior member of the firm, is a hustler, attending to the store and office, while Mr. Graham looks after the plumbing and tinning departments. The remarkable success of the firm is attributed to the combined efforts of the two members of the firm, each managing his respective part of the business with marked ability.

Daniel C. Hasbrouck, aside from his other interests, carries on the hardware business at New Paltz, which place is situated about 4 miles from the beautiful Lakes Mohonk and Minnewaska. Mr. Hasbrouck makes a specialty of the Sterling stoves and ranges, made by the Sill Stove Works, and carries a full stock of farming tools, heavy and shelf hardware, and employs several men in his plumbing and tinning shop. He enjoys a large trade among the fruit growers, fruit growing being the chief industry in the vicinity.

John Ettinge is also located at New Paltz and does a general tinning and jobbing business. He makes a specialty of the Manhattan stoves and ranges of Eugene Munsell & Co. He has been in the business for 50 years or more, and has witnessed the many changes which have taken place in the trade, one of special note being the elimination of the so-called home made tinware, this being superseded by the wares manufactured by the large stamping companies.

J. P. Caswell is engaged in the stove and hardware business at Walkkill. He makes a specialty of the Dockash stoves and ranges, made by the Scranton Stove Works; the Argand, made by the Perry

View Showing Arrangement of Parts and Course of Air Currents and Products of Combustion in the Champion Steel Range.

springs raising and holding the door in position when opened or closed. The hot air flue 2 is located below the main heating flue, and has a draft damper on the right side of the range, so that when the damper is opened the draft will draw the air through the flue to the ash pit. The manufacturers state that the air passing through this flue carries the wasted heat through the ash pit into the fire pot, forming a hot air combustion. The Champion range is also made with low down reservoir and is offered in several sizes.

S. W. MILLIGAN, 101 Beekman street, New York, is prepared to supply the trade with the varied line of tinware

Stove Company, and the Sunshlue, made by the Reading Stove Works. Mr. Caswell does considerable in tin roofing and general jobbing, his trade being principally with the farmers who come each day to the village for the purpose of bringing milk to the Borden condenser.

Eddyville is located at the terminus of the Delaware & Hudson Canal, which is 3 miles from the Hudson River. It is here that Eltinge Longyear is engaged in the stove and hardware business, making a specialty of the Dockash ranges, made by the Scranton Stove Works, and the American ventilator, manufactured by J. Van Wormer & Co. Previous to 1893 Mr. Longyear was in partnership with his brother, the firm name being Longyear Brothers. In that year, however, the senior partner withdrew on account of his extensive interests in the manufacture of an adjustable stove pipe shelf which has met with a large sale.

Newton Davis is also located at this place, conducting a stove and tinware business. He makes a specialty of the Argand line of stoves, ranges and heaters, manufactured by the Perry Stove Company, and has built up a good trade in them.

Fifteen miles to the south of Kingeton, beautifully situated on the bank of the Hudson River, lies the village of Highland. Here J. W. Feeter conducts the hardware, plumbing and stove business. His leading lines of stoves are the Andes of the Phillips & Clark Stove Company and the West Shore, made by the Littlefield Stove Company. He has recently constructed an addition to his store which enables him to display his goods to much better advantage than heretofore. Mr. Feeter has charge of the village water works, and this, in connection with his plumbing and tin business, enables him to employ a number of men.

William Beckett has been in business at this place for many years selling the Argand line of the Perry Stove Company with gratifying results. He also gives attention to tin roofing and general jobbing and in these lines has a good trade.

Gilmour Atomizer.

American Ball Nozzle Company, 837-847 Broadway, New York, have brought out the Gilmour atomizer, as

The Gilmour Atomizer.

here shown. It is constructed specifically for charging with insecticides and chemicals to be used for a variety of purposes with water or steam. The atomizer is 10 inches long including the removable nozzle. The lower part is 3½ inches wide and 1 inch deep, tapering abruptly at both ends for coupling purposes.

The cylinder is 4½ x 2½ inches and is screwed on to the horizontal body, there being a perforated metal plate at the bottom of the cylinder to sustain powders, crystals, &c., and to allow of a free circulation of water or steam continuously through the mass. Soap in cake form or similar materials can be placed in the main channel for washing windows or fronts of houses, rinsing off at once with a clear stream of water by a turn of the plug, which instantly directs the current through a by pass.

While the atomizer is neither bulky nor heavy, if found undesirable to hold in the hand it can be attached to the source of supply, the hose coupled on and the removable ball nozzle, which combines direct stream, ball spray and shut off in itself, fastened to the delivery point.

The plug operated by the lever at the left of the cut in itself causes a number of combinations, including a direct stream of pure water, or causes the flow to pass through the various ingredients placed in the main portion or cylinder.

The cylinder can be loaded with pastes, emulsions, oils, soaps or soap powders, crystals and chemicals or insecticides, as desired, for destroying insects on flowers, shrubs, vines, trees, &c., and for disinfecting and killing vermin and germs of disease wherever they can be attacked with a stream of water. This is especially feasible in stables, barns, outhouses, coops, kennels, &c., or by connecting with steam hose it can be used for the fumigation of holds of vessels, cellars, &c.

This device is said to insure a uniform solution, especially where Paris green is used, which settles rapidly when mixed in tanks and barrels. The atomizer and nozzle are cast brass nickelled.

Eureka Self Measuring Oil Tank.

J. R. West, Gas City, Ind., has brought out a new self measuring oil tank, on which a patent was secured by him during the past month. The tank is herewith illustrated. Its operation is simple. The oil is pumped into a reservoir above the tank, which holds 5 gallons. A gauge in the reservoir, worked by a float, indicates the exact amount of oil inside, from 1 pint to 5 gallons. The oil is then transferred to

amount is being drawn. The tank is made of the best galvanized iron, and each is thoroughly tested before leaving the factory. The pump of the floor tank is detachable, so that it may be used to pump the oil from the barrel to the tank. Floor tanks are made to hold 60, 110 and 165 gallons. A cellar tank is

Eureka Self Measuring Oil Tank.

also made on the same principle, the tank being placed in the cellar and the receiving reservoir in the salesroom, requiring a floor space of only 16 inches for the pump, reservoir and drip. The oil can be taken from the barrel and discharged directly into the tank through the drip pipe, avoiding the leakage or spilling of any oil on the floor of the salesroom. Cellar tanks are built to hold from two to five barrels. With this device no measures whatever are needed.

MEMORANDA.

THE PARTNERSHIP existing under the firm name of L. & P. Bargelt, Hanover, Pa., has been dissolved, the business being continued under the name of Louis Bargelt.

CURRIER & BRADSHAW is the name of a firm who have succeeded to the stove and hardware business hitherto carried on by H. J. Bradshaw, Paris, Tenn.

THE FIRM of Holton & Wells, stove and hardware dealers, Kirkland, Ark., have been dissolved and their business will in future be conducted by J. A. Wells, under his own name.

W. C. FOSTER, Little Rock, Ark., has purchased the hardware and stove business of the Foster Hardware Company of that place.

LUKE & BARNES, 208 South Third street, Grand Forks, N. Dak., issue a very handsome publication relating to the furnaces which they handle, and also give a list of those who have used their furnaces and letters from prominent persons speaking highly of their goods. Luke & Barnes likewise deal in hardware, tinware, trimmings, building papers, paints, ranges, &c. The catalogue is of oblong shape, bound in water line parchment, which gives a novel and handsome effect. The printing on the cover is done in red and green ink, and the whole pamphlet is an excellent example of fine press work.

PLUMBING and GAS FITTING.

Plumbing Regulations Beneficial.

In the Board of Health report of Manchester, N. H., there are the following forcible remarks dealing with the plumbing question:

The plumbing regulations have been in force since May 1. Their framing and adoption by the board took much time. While they were being considered the Board met a delegation or committee from the journeymen plumbers and the master plumbers in a body. At each of these meetings the regulations were considered one by one and thoroughly discussed. The science of sanitary plumbing is comparatively new, but there are old principles of ventilation and traps which time and experience have proved to be correct. The board endeavored to embrace in its rules only such things as seemed absolutely necessary, and rejected much that was brought to its notice with an idea of making a dollar for somebody. Any suggestion which was necessary for the safety of the public was adopted. With these ideas in view a set of regulations was produced which was published by and met the approval of some of the best sanitary papers in the country. They have worked to the satisfaction of all parties concerned who care to be honest and workmanlike in their dealings. Circumstances and conditions, unforeseen, when the rules were adopted, have arisen and it will be necessary to make some slight changes, but we believe the city is to be congratulated on having so plain, businesslike and safe a set of regulations. Their need has been amply proved since their adoption. At least 50 per cent. of the lines of main pipe have shown leaks when submitted to the water test, and the plumbers have been obliged to make the joints tight in the presence of the inspector. If work which was put together with the understanding it must stand test fails to do so, what can be expected of that which has been thrown together with a knowledge that it never would be tested? There is no doubt that much of the work done before the plumbing regulations were adopted is faulty in the extreme. Men may be honest but careless. Some are dishonest as well as careless, and when either of these conditions occur, or when cheapness has been the only end sought by the landlord, the result must be deplorable to the tenant or occupant of a building so plumbed. Some old blocks have been examined by this board and measures taken toward the improvement of the plumbing. We are in hopes in time to remedy the careless or criminal work which was put in before the rules were adopted. The board would advise that in all buildings being erected, whether on sewered streets or not, provisions be made for the plumbing which must in time be put in, as it is much cheaper and better to have such arrangements made when the house is erected, and often prevents much costly tearing out and rebuilding.

CHARLES THATCHER, after a sickness of nearly a year, died at his home, 36 Walnut street, Waterbury, Conn.,

last week. The deceased was born in Stockport, England, and was 60 years old. He resided in Waterbury 32 years. Shortly after his arrival in Waterbury he was employed by E. R. Lampson, of whom he learned his trade. Later he engaged in the plumbing business himself, combined with the sheet metal trade, and then dealing in stoves and hardware. His first business associate was William H. Clark, who was succeeded in the firm by Robert Dixon. Mr. Thatcher continued the business alone until 1890, when the Chas. Thatcher Company were formed, with the following officers: Charles Thatcher, president; C. G. Belfit, vice-president and manager, and H. L. Slanson, secretary and treasurer. Mr. Thatcher was also at the head of the firm of Charles Thatcher & Co., but on account of his sickness was compelled to retire.

Exposed Plumbing.

BY SAMUEL REINS.

The leakage of water pipes behind decorated walls and fine ceilings is a sufficient argument against incasing or covering service pipes. The repairs are generally costly, and entail the additional services of the carpenter and decorator. Pipes in casings or placed in walls or partitions as they pass from floor to floor provide especially inviting runways for rats, mice and vermin of all kinds. Nests are built in these places, and pieces of paper, rags and food are carried into them so that they eventually become filthy. The casings or wall pockets, as the case may be, act as ventilating shafts, and distribute the odors from the kitchen and cellar to other parts of the building. In the performance of this work they are faithful and impartial. The hollow walls and floors which are universal in the American system of construction greatly assist in this work.

If any accident occurs in an exposed system, the point at which the break takes place can be reached at once and repairs easily made. The quality of the exposed plumbing work gains pride in putting up work that is creditable to his workmanship when it is to be on continual exhibition. Exposed pipes may be passed through floors without having a large opening; and the space around the pipes can be made perfectly tight so that the passage of odors is cut off completely. This is a great gain, and the runways for rats, mice and vermin are entirely done away with. These pests can then be exterminated. This is practically impossible in houses where casings protect them and afford perfect breeding places. Cut off these free passages to all parts of the house and they prefer more congenial quarters, where rapid transit is provided and fields for colonization are unlimited.

The appearance of the cast iron pipes may be often made to harmonize with the decorative features of the room. The body of the pipe shows very well when covered with a very dark bluish gray scarcely removed from black. Bands of silver bronze around the hubs and other points on the pipe relieve the monotony; or the whole pipe can be finished in two or three shades of

bronze. Lead and wrought iron pipe may receive a similar treatment. If galvanized iron pipe is used and it is clean and bright in appearance, a coat of varnish is all that is needed. Lead pipe never looks handsomer than when carefully polished and varnished, so as to preserve its brightness. There is no difficulty when a little ingenuity is used in making the decoration of the exposed pipes quite effective.

Justice to the Plumber.

For more than a year the daily press of New York City have accepted the report which intimates that favoritism has ruled the Board of Plumbing Examiners of the city. During this time influence from various quarters has been brought to bear upon this board in the interests of different parties; but the law was of such character that the duties of the board were plain. It is to their credit that they have adhered closely to the law. Recently, during the trial of a plumber who had violated the law, the justice before whom the case was tried stated that the act under which he was arraigned was a bad law and that he would impose the lightest possible fine. He further asserted, "I know of one man who has been a master plumber for twenty-five years, and yet cannot join the Master Plumbers' Association because he will not pay the \$300 registration fees." The attention of John Mitchell, president of the National Association of Master Plumbers, who is at the present time president of the Master Plumbers' Association of New York, was called to this statement, and he states positively that the justice is wrongly informed. There is not now, and never has been, any disposition to prevent any licensed master plumber from joining the Master Plumbers' Association of New York who is willing to abide by its rules. These rules seem to be vindicated from the fact that the association has a membership of nearly 400, and that among these men are the most prominent and respected master plumbers of the city. The entrance fee to this association is nominal and the dues reasonable. The only condition under which a plumber would be amenable to the association for any such sum as \$300 would be as a result of a fine for infringing upon its laid down laws. For carelessness and failure to acquaint themselves with the laws of the association, fines of \$25 and \$50 have been frequently inflicted upon offending members; and in some cases, where the offending member has persisted in pursuing a course contrary to the laws of the association, fines of \$100 and \$250 have been paid, an acknowledgment of the correctness of the policy of the association and of the wrongdoing of offending members. In some cases the members have seen fit to withdraw or submit to the expulsion laws of the association rather than pay the fines; and under these conditions, until the fine is paid, such plumbers would be debarred from the association. Plumbers' licenses have been granted to all competent plumbers, whether members of the association or not, and whether having a large plumbing establishment or only a cellar of the residence of the plumber. A careful investigation will show that any applicant who conforms with the pro-

visions of the law and possesses the necessary intelligence to pass the examination prepared by the board will have no difficulty in receiving a certificate which enables him to take out his license after filing his bond in the proper city department.

Convention Gossip.

No DETAILS regarding the programme have been given officially, but it is learned that the convention will be opened on Tuesday morning with an address of welcome by Mayor Warwick. President John Mitchell will make a suitable response, after which the business proper of the convention will commence. In the afternoon the visiting ladies will be taken in barouches for a drive through Fairmount Park by the members of the Ladies' Reception Committee. The steamer "Chauncey Vibbard" has been chartered, and on one afternoon will make a trip down to Cramp's shipyard, and afterward to Lincoln Park, on the Delaware, where, after enjoying the attractions of the place, the visitors will be entertained at dinner at the hotel. On Friday, after the close of the convention, the visitors will be taken on a special train to Atlantic City, ten-day return tickets being presented to each delegate.

* * *

THE PHILADELPHIA MASTER PLUMBERS are busy completing their arrangements for the entertainment of the visiting delegates. Their programme is expected to be ready for distribution this morning (Saturday). Its contents have not yet been made known to the public, but that it will be a substantial entertainment there can be no doubt.

* * *

THE Philadelphia Master Plumbers' Association Committee on Arrangements consists of the following members: Wm. McCoach, chairman; Wm. S. Clark, secretary and treasurer; Sam'l W. Barnes, Geo. W. Beckett, A. G. Bond, Frank P. Brown, S. Louis Barnes, Wm. Calboun, John E. Eyanson, Wm. H. Doyle, S. B. Fleming, John Furlow, John Gornily, Wm. Harkness, Jr., A. M. Hicks, Walter Jones, Arthur B. Lange, Wm. W. Mentzinger, Wm. L. Owens, Chas. L. Parmelee, J. V. Reagan, W. R. Ross, G. Wallace Smith, Geo. F. Uber, L. N. Yearsley.

* * *

THE WALNUT STREET THEATER is a large and commodious theatre, and will prove comfortable, no matter what weather may be experienced. It is probable that electric fans will be put in for the occasion, which will be a further assurance of comfort.

* * *

THE LADIES' RECEPTION COMMITTEE of the Philadelphia Master Plumbers comprises the following ladies: Mrs. Wm. McCoach, Mrs. W. S. Clark, Mrs. S. W. Barnes, Mrs. Geo. W. Beckett, Mrs. A. G. Bond, Mrs. G. C. Bond, Miss Hattie Bond, Mrs. F. P. Brown, Mrs. S. L. Barnes, Mrs. J. E. Eyanson, Miss Bessie Eyanson, Miss Evaline Clark, Mrs. Wm. J. Carroll, Mrs. J. P. Crombarger, Mrs. C. P. Donnelly, Mrs. W. H. Doyle, Miss Blanche Feaster, Mrs. S. B. Fleming, Mrs. M. Furlow, Miss Jeannette V. Harkness, Mrs. Wm. H. Hallman, Mrs. A. M. Hicks, Miss Ella Hicks, Miss Clara Hicks, Mrs. W. Jones, Mrs. M. P. Kingeater, Mrs. A. B. Lange, Mrs. C. Mealy, Mrs. W. W. Mentzinger.

ger, Mrs. Thos. McCarthy, Mr. David McCoach, Mrs. W. L. Owens, Mrs. W. I. Raymond, Mrs. J. V. Reagan, Mrs. E. Remick, Mrs. W. R. Ross, Mrs. G. W. Smith, Mrs. M. Starr, Mrs. G. E. Uber, Mrs. L. N. Yearsley, Mrs. E. Smith Williams.

* * *

DELEGATES who are preparing jokes on the "slowness" of the Quaker City should be careful to get them off early, as after the reception which will be accorded the visitors and the entertainment which will be provided such jokes will fall rather flat. The Philadelphia plumbers, no doubt, will be prepared to listen once more to all the jokes on their city which have appeared in the comic and other papers for the last few years and to appear amused, but to a Philadelphian "chestnuts" of this kind are nauseating and are tolerated only on account of the submissive spirit which prevails in the City of Brotherly Love.

TRAPS AND VENTS.

W. A. FAUST of Pittston, Pa., has bought out the plumbing shop of Wm. Gilchrist of Wilkes-Barre; J. T. Johns of Wilkes-Barre, Pa., will take charge of the shop at Pittston.

C. S. EAMES, the well-known Bridgeport, Conn., plumber, has been elected a member of the Building Commission of that city, and will assume the duties of his position July 10.

THE VANDERMAN PLUMBING & HEATING COMPANY, Willimantic, Conn., are issuing a 20-page catalogue of the plumbing and heating specialties invented by Wm. Vanderman, a half-tone engraving of whom is shown on the front cover. The first few pages show the different styles of steel tool chests for pipe fitters and plumbers. This is followed by the recently patented hot water expansion tank, lead and iron pipe cutters, lead pipe benders and asbestos lead joint runners for soil pipe, water closet connections, bench pipe vises, which can also be used as mechanics' vises, provided with a combination for bending pipe; hinged and solid frame pipe vises, radiator trucks and radiator union valve, elbow connections and pipe holders for joint wiping. The last page is devoted to Vanderman's Plumbers' Estimate List Book, made in two sizes, for office and for pocket use.

YOUNGSTROM & WELSH, Phoenix, Arizona, are justly proud of a fine piece of plumbing which they have completed in the residence of Dr. J. N. Ford, who has made something of a study of modern plumbing. The bathroom has a porcelain lined, rolled rim bath, handsome lavatory and a noiseless water closet. All the wood and finishing in the bathroom is of polished cherry. The basin and bath cocks, traps and fixtures are all nickel-plated, and are connected with the service and waste pipes by means of lead pipe and brass ferrules. One of the special features of the bathroom is an instantaneous water heater, using gas for a fuel. This is said to be the first high grade plumbing system that has been installed in their city, heretofore fixtures of a commoner grade having been used.

McGRATH & GOODRICH have succeeded to the plumbing business of Thomas McGrath at Memphis, Tenn.

THOMAS ROBERTS, Main street, Toms River, N. J., having added plumbing, steam and hot water heating to his stove and hardware business, will be glad to receive catalogues and prices from the trade.

FRANK W. HUBBARD, son of W. B. Hubbard, manager of Peck Bros. & Co.'s Boston store, 65 Oliver street, has recently taken a vacation trip to New York and the factory at New Haven.

J. E. ZIMMERMAN, representing Ideal Mfg. Company, Detroit, Michigan, recently renewed his acquaintance with the Boston trade.

THE McVEY & WALKER FOUNDRY & CAR COMPANY of Braddock, Pa., have almost completed a large extension to their big plant on Ninth street and Halket avenue, Braddock, for the manufacture of bathtubs. All kinds of enameled tubs and linings and fixtures will be made.

A MASTER PLUMBERS' ASSOCIATION affiliated with the National Association of Master Plumbers was organized at Easton, Pa., last week. The meeting was held at the rooms of John Mack and was attended by representatives of 14 plumbing firms in Easton and South Easton, Pa., and Phillipsburg, N. J. The following were elected officers: President, John Mack; vice-president, William C. Kelly; secretary, John Beam; treasurer, John Thume.

J. C. SHANNON & SON of Penn Yan, N. Y., have purchased the plumbing business of Amsbury & Brown.

The following master plumbers have duly passed an examination which fits them to do plumbing in Cohoes, N. Y.: John Clark, R. H. Mott, W. J. English, Robert Campbell, James Bathgate, A. G. Burbanks, Bartholomew Cooney, John Maguire, John B. Golden, H. Lancaster, David Clark, William Loop, Wm. J. Barrett, Charles Vandercook, inspector. The members of the plumbing board, H. E. Bottum and Elias V. Cady, are also eligible to do plumbing.

A NEW industry will be started at Holly, Mich., under the style of the Holly Bath Tub Company. E. M. Day of Detroit is interested.

ALL of the plumbers in Ann Arbor, Mich., have taken out a license permitting them to take contracts for house connection with the sewer. The employees have also taken out certificates of competency.

J. BREWSTER and WILLIAM LEAHY, two well-known journeymen plumbers in Decatur, Ill., have decided to go into business for themselves at the corner of North Park and Franklin streets, and will be prepared to do plumbing, steam and gas fitting.

J. A. CURTIS and J. J. BENNER have purchased from L. B. Curtis the heating, tinning and plumbing branch of his business at Red Hook, N. Y., and will continue the business under the firm name of Curtis & Benner.

GEO. MAHL, Hartford, Conn., has a lively young plumber in his employ, the 100 yards dash, open to apprentice plumbers at the journeymen plumbers' picnic, for a set of tools, having been won by Barney Fitzsimmons.

At the annual meeting of the Florida State Association of Master Plumbers, which was held in Jacksonville last week, the following officers were elected for the ensuing year: William Clarke of Jacksonville, president; J. W. Roberts of Tampa, first vice-president; E. M. Greeson of Tampa, second vice-president; John Einig of Jacksonville, secretary; J. E. Kuchler of Jacksonville, treasurer; L. C. Yaeger of Tallahassee, sergeant-at-arms; delegates to national convention to be held in Philadelphia on June 11, John Einig and J. W. Roberts.

At an adjourned meeting of the plumbing board of Yonkers, N. Y., an

application for certificate of competency was received from F. W. Sutton, No. 31 Twelfth avenue, Mount Vernon, and certificates of competency were granted to James Moen of No. 4 Vineyard avenue, and Andrew B. Bare, No. 72 Buena Vista avenue.

ROSENHEIM, LINCK & ITTNER, St. Louis architects, are, we are advised, now specifying Star Couplers made by the Star Coupler Company of St. Louis, instead of ground joints. One of the principal reasons given for specifying the Star Couplers is that it lessens the number of joints used at least one-half, for they explain that in a job where ground joints are used it is necessary to make a wiped joint, and this, together with the ground joint, makes two joints necessary to complete the work, whereas in using the Star Coupler only one joint is necessary and absolutely no joint wiping is required. Another feature is the cheapness of Star Couplers, which have recently been reduced in price on account of increased facilities for their manufacture.

THE E. S. WHEELER COMPANY, New Haven, Conn., have moved their New York office to Room 307, Beekman Building, 101 Beekman street, and are prepared to quote prices on tin plate and plumbers' supplies. B. & H. H. Summer, dealers in plumbers' specialties, share the office with them.

A. D. EVERTSEN, 639 East 138th street, New York, adorns his letter-head with an engraving of "a pushing plumber." It represents a workman with wheelbarrow laden with a water closet, a pump, a laundry tub and some traps and fittings, on his way to do a job.

THE PENNSYLVANIA RANGE BOILER COMPANY has been incorporated at Philadelphia, with a capital stock of \$75,000; the directors are Edmund L. Leoy, William H. Marsh, John P. Harlan, Lawrence B. Leoy, G. Eugene Harlan, Philadelphia.

HENRY STEIN has taken an office at Room 209 in the Beekman Building, 101 Beekman street, New York. He makes a specialty of brass goods for steam, water and gas, and has a line of sanitary specialties. Mr. Stein carries a stock of these goods and is prepared to fill orders promptly. He will also look after the interests of the Star Coupler, made by the Star Coupler Company, St. Louis, Mo., in the Eastern States.

B. FRANK HOOPER, president of the Colwell Lead Company, is back again at his desk at 63 Centre street, New York. Mr. Hooper was accorded a royal reception by his friends on his arrival on the steamer "Umbria" last Saturday evening, after a two months' holiday tour in Europe, in the course of which he covered a large amount of ground and visited a number of interesting scenes both on the Continent and in England. He returns greatly benefited in health and in vigor from his well-earned holiday.

BAILETT & HORMAN are a new plumbing firm at 191 Clinton avenue, Newark, N. J.

MCVAY & WALKER, car builders, founders and machinists, Braddock, Pa., have made some additions and alterations to their plant, with a view to engaging in the manufacture of enameled bathtubs, sinks and other similar goods. The firm will give employment to a considerably larger force of men as soon as the new departments have been put in operation.

AMONG the plumbing establishments recently started in Chicago can be mentioned the following: John Kenny,

946 Ashland avenue; H. R. World & Co., 4148 Cottage Grove avenue; A. McNeil, 2453 Wabash avenue; Willis Carpenter, 2428 St. Charles avenue; Thomas Coleman, 2097 West Lake street; John L. Fruin, 5031 State street; M. E. Breen, 156 Blue Island avenue; Frank Murphy, 3457 Dearborn street.

THE PLUMBING ESTABLISHMENT of Thomas E. Weber, 234 Penn street, Reading, Pa., was visited by fire last week.

THE PLUMBING FIRM of Trotter & Buck, Altoona, Pa., have been dissolved. The business will be carried on hereafter by L. Trotter at the old stand, 1714 Eleventh avenue.

LAWRENCE RICKETTS died last week at Pittsburgh, Pa., aged 87 years. Mr. Ricketts was a native of Ireland and came to Pittsburgh in 1843, and for a number of years was foreman in a local mill. He was the father of James J. Ricketts, the Oakland plumber, and Lawrence Ricketts, who is in the plumbing business on Ross street. Besides his sons his wife and two daughters survive him.

ROBERT STANLEY, Bar Harbor, Maine, is about to move into his new plumbing shop.

W. I. NORTON & Co. have rented the store room recently vacated by Ingwersen & Wilhelmson on Second street, Port Clinton, Ohio, and will shortly open a plumbing shop.

P. J. WHELAN, formerly foreman for the Stifel O'Neil H. C. Company, St. Louis, Mo., plumbers, has left that concern and opened up for himself with Robt. Jacobs, Jr., as partner, at 107 North Eleventh street, between Pine and Chestnut streets, where they will do business in the plumbing and gas fitting line.

THE LAWRENCE-LETTES ELBOW COMPANY, LIMITED, Waverly, N. Y., have completed an extension to their present plant for the manufacture of the O. H. one-piece stove pipe and conductor elbows. The addition to the works is a three story and basement building 50 x 115 feet and is newly equipped with machinery and tools to meet the requirements of a largely increased demand for their product.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until June 21 for the work, including the sheathing and completion of the roofs and skylight of the United States Court-House, Custom House and Post Office Building at Omaha, Neb. Drawings and specifications may be had from the Supervising Architect, Washington, or of the Superintendent at Omaha.

The report of British Consul-General Sharpe, at Zomba, on the growth of the trade of British Central Africa during last year, indicates a considerable expansion in the total imports and exports of that region as compared with those of 1893. The increase in imports is chiefly seen in cotton goods, provisions and hardware. Exports of coffee have nearly doubled, and this industry is receiving a great deal of attention, coffee planting promising to be the leading business of British Central Africa in the future. Mr. Sharpe mentions a very serious increase in exports of ivory, which is every year becoming scarcer and more difficult to obtain on account of the gradual extermination of the African elephant.

Tinned Plate Manufacturers' Association.

The annual meeting of the Tinned Plate Manufacturers' Association of the United States was held in the Conestoga Building, Pittsburgh, Pa., on Wednesday, June 5, W. C. Crone-meyer in the chair and John Jarrett secretary. The annual election of officers was held and resulted as follows: W. T. Graham of the Aetna-Standard Iron & Steel Company, Bridgeport, Ohio, president; Warner Arms of the Falcon Iron & Tin Plate Company, Niles, Ohio, vice-president, and John Jarrett, secretary and treasurer. An Executive Committee was also elected, consisting of Alfred Marshall, C. R. Britton, D. M. Somers, W. B. Leeds, William Banfield, T. K. Niedringhaus, W. C. Cronemeyer, George Greer and A. W. Brown. The attendance at the meeting was large, 27 concerns being represented. An informal discussion of the wage question was had and a Conference Committee appointed consisting of W. T. Graham, Warner Arms, W. B. Leeds, George Greer, A. W. Brown, C. M. Stuart and J. B. Strawbridge. As soon as notified by the Amalgamated Association that the scale is ready a conference will be held between this committee and a similar committee from the above organization. The statement made in a number of Pittsburgh papers, and attributed to Secretary Jarrett, to the effect that the manufacturers would ask this year a reduction in the scale of from 12½ to 15 per cent., is untrue. Mr. Jarrett has not expressed himself on the wage question and will not do so until the scale now under preparation by the Amalgamated Association is made known. A conference is expected to be held within the next two weeks.

While conducting a series of tests with a 100-ton testing machine at the Yorkshire College, in England, which included the testing of a steel wire rope, Professor Goodman stated that such ropes were not a modern invention, and that he had recently seen a bronze wire rope, ½ inch in diameter and from 20 to 30 feet long, which had been found buried in the ruins of Pompeii and which must have been at least 1900 years old.

Buffalo, N. Y., journals state that buildings are now in course of erection in that city that will cost over \$11,000,000. One of these, the Elliott Square Building, is to contain 600 offices, besides stores, *cafés*, &c.

The International Exposition, to open in the City of Mexico on April 2 of next year, will be located within ten minutes' ride of the center of the city, on an area of 700 acres surrounding the Castle of Chapultepec, the residence of the President of the Republic. The exposition grounds will be divided into three large courts, named respectively the Grand Court, the Mexican National Court and the Foreign Court. Among the special attractions will be a scenic railway, a captive balloon, an Indian village and a Mexican mining camp.

STOVE TRADE NOTES.

Western Freight Rates on Stoves.

The Western stove trade is again brought face to face with a threatened advance in railroad freight rates. It will be remembered that the Joint Western Classification Committee, representing all the railroads in the territory east of the Rocky Mountains, decided last fall to advance the stove classification from third to second class, to take effect on January 1. Manufacturers and merchants strongly opposed the change at that time, on the ground that the stove trade was not in condition to warrant the imposition of higher freight rates. The business was still feeling the severity of the depression, and it was believed that the contemplated advance would have an injurious effect on the limited demand. The trade needed encouragement, and not repressive measures. A hearing was granted to representative stove men, who presented such convincing arguments to the committee that the change was not made. It was, however, not completely disposed of, as the committee decided to lay the matter over for six months. This makes the proposed change go into effect July 1, unless corrective action is again taken. An organized effort will be made by the trade to suspend or revoke the action of the committee.

The change in classification will make an average advance of about 30 per cent. in existing freight rates, which is quite a serious addition to the cost of stoves to the country merchant. It is true that business has recently shown some improvement, but it is not yet of a character to warrant such a sharp advance in freights as the proposed change in classification would bring about. The volume is still far below the level of ordinary times, and it is believed that the interests of the railroad companies lie in the direction of securing more traffic rather than in asking higher rates on what they are now carrying. Every stove manufacturer is tenderly cultivating the least appearance of an improvement in the demand from his customers, and is especially careful not to check a tendency to reviving trade by too quickly advancing prices. The same policy should actuate railroad managers, who are in a position to assist or retard the improvement. Merchants can assist the manufacturers in opposing the change. They should protest against it with all the vigor of which they are capable, and if their protests pile up in managers' offices they cannot fail to receive respectful consideration.

Taplin, Rice & Co.

Akron, Ohio, have issued a very neat catalogue and price-list of stoves and ranges which they manufacture in many varieties. The little volume bears date of May 1 and consists of 86 pages, printed in blue-black ink upon a good quality of paper and bound in terra cotta covers with an embossed side title. The manufacturers state that at the earnest request of their friends, and in order to meet the growing demands of the trade, they have brought out a line of steel ranges, offered under the name Steel Climax. The range is made of cold rolled malleable steel plate with tight joints, dust proof oven, the bottoms being securely braced with bars of iron bolted with countersunk head bolts at intervals of 3 inches, thus guarding against warping or buckling. The covers, centers, top rims and top sections and fire box linings, grates, &c., are extra heavy and made of best quality iron. The fire box, which is oval in shape and fitted with a duplex grate, rests upon a perforated frame in such a way as to give complete ventilation, thereby protecting the linings and preventing them from burning out. An extension fire box capable of receiving 26-inch wood is furnished when required, and can be readily attached by simply taking out the back end jamb. The flues and end of the fire box are asbestos lined, while the bottom of the oven flue is lined with fire proof cement. The water front is of malleable iron, tested to 180 pounds pressure, and so constructed as to form the front end of the fire box. The body, closets and shelves of the Steel Climax are enameled with japan, giving a high polish and durable finish. The Steel Climax is shown in the catalogue in several varieties, and is adapted for burning hard or soft coal, coke or wood. Attention is also invited to the Steel Climax laundry stove for coal, coke or wood, having a capacity for 75 sad irons or 70 tray polishing irons at one time. Laundry stove No. 14 has a capacity for 32 irons at one time, or when the top is used for boiling purposes 10 irons can be heated around the sides. The Air Tight Climax is a handsomely decorated parlor heater made in three sizes for soft coal, and is offered as a novelty for the season of 1895. It embodies the latest improvements and the manufacturers are confident that it will prove popular with the trade. The Round Climax for coal or wood is an oak stove which has been improved for this season. The catalogue concludes with an illustration of the World's Best furnace, made by May & Fieberger, and of which Taplin, Rice & Co. are also manufacturers and selling agents.

SCHILL BROTHERS of Crestline, Ohio, have just issued from the press an exceedingly attractive pamphlet illustrating and describing their line of steel ranges, for the manufacture of which they have a well equipped plant. The pamphlet is printed upon tinted paper and bound in white covers of unique texture. The pages are stitched through the back and tied with a silken cord of a delicate shade of pink, while the side title consists of the words "Schill's Steel Ranges," printed in old

gold. The goods illustrated and described are offered in a variety of styles and sizes and embody features to which reference was made in the review of the advance copy of the catalogue a few weeks ago.

A New Trade-Mark.

A new trade-mark has recently been adopted by Southard, Robertson & Co., with foundries at Peekskill, N. Y., and office and warehouses at 257-259 Water street and 21-27 Peck slip, New York City. An idea of the design of this trade-mark may be gained from an inspection of the accompanying illustration. It will be observed that the design is appropriate to the generic name under which the company manufacture a varied assortment of stoves, ranges and heaters. The word "Magnetic" at once suggests the compass

A New Trade-Mark.

which forms the central feature of the design. The compass is framed, as it were, in a steering wheel, around the rim of which appears the word "Magnetic," and the name and address of the company. Immediately above the compass are the words, "Stoves, Ranges and Heaters," while below is the inscription "Warranted True as the Magnet."

ODD PLATES.

D. S. RICHARDSON of the Richardson & Boynton Company, New York, has been granted a patent for a hot air furnace construction which supplies air at high temperature at the surface of the fire, for the purpose of consuming the gases that are thrown off at the surface of the fire. It is claimed that by supplying this air at a temperature of approximately 800 degrees an immediate intermixture with the products of combustion is gained, causing their prompt ignition and consumption.

THE PENINSULAR STOVE COMPANY of Detroit, Mich., have in process of preparation two handsome publications, one of which will constitute a regular stove catalogue, and the other a special volume devoted to the company's hot water and warm air heating apparatus. The publications are to be first class in every particular, and the company ex-

pect them to be the finest ever placed before the stove and furnace trade by a manufacturer. They will show the recent additions which the company have made to their varied assortment and call attention to the leading features which have been incorporated. In the stove and range line will be shown new and original productions, including a complete series of air tight heaters of handsome finish and varied as regards styles and sizes; an entirely new hard coal base burner, first class in all respects; two entirely new lines of wood parlor stoves made in both direct draft and base heated patterns; an entirely new production in an exclusively wood burning cook stove made in a variety of styles and sizes and finished in strictly high grade class; two separate and distinct lines of wood cooks of new design and ornamentation; two new wood burning ranges embracing the popular styles and sizes in four and six hole tops; a new high grade six-hole coal and wood range; two new and original productions in medium priced coal and wood ranges, comprising all popular styles and sizes with four and six hole tops; a new low priced coal range of original design and construction made in the usual styles and sizes with six-hole top; an original production in the way of a low priced coal and wood cook and coal and wood burning four-hole range. In the furnace department the catalogue will show a large and complete line of goods adapted to meet the varying requirements of the trade. This company have devoted no little time to making their warm air and hot water combination heaters complete in every particular, and have made additions to their wood burning furnaces and combined wood and coal burning heaters which cannot fail to be appreciated by wide awake, enterprising dealers, and especially those handling the Peninsular lines.

AN English hardware journal reports that the production of oil stoves at the foundries of Birmingham and the Black Country has been prodigious during the past season, one firm in that district having turned out an average of 1500 each week.

THE GRATE MANUFACTURERS' ASSOCIATION of Western Pennsylvania and Eastern Ohio has just been formed, composed of James McCullough, Jr., of Kittanning, Pa.; Knott, Harker & Co. of Beaver Falls, Pa.; W. L. Sharp & Son, Steubenville, Ohio, and the George L. Conn Foundry Company, also of Steubenville, Ohio. The circular which has been issued in regard to the matter states that owing to the recent and prospective advance in cost of manufacture, and in view of the fact that goods have been sold for less than actual cost, the members of the association have agreed upon a uniform scale of prices in the future. This scale applies particularly to what are known as "grates and fronts," which the four concerns named manufacture in common for the bituminous coal region within 100 miles of Pittsburgh. The circular states that former prices are to be withdrawn and that the new prices will be low, as the members of the association have no wish to take advantage of their friends, but hope as soon as trade revives to be warranted in a further advance in order that they may realize a reasonable profit in manufacturing. The circular bears date of June 1.

THE RUTLAND FIRE CLAY COMPANY of Rutland, Vt., are making use of a novel circular to aid in the collection of their small scattered accounts. The text of the circular, which is printed in red and in short lines with display type, is as follows: "We need Money. Have heavy bills coming due. Inclosed

we hand you statement of your account with us. The amount is not very large. The small amounts all help us to pay our bills. You can pay this account any day. Why put it off any longer? The payment will help us out. Why not mail us your check to-day? We will appreciate it."

THE CENTRAL OILGAS STOVE COMPANY have recently resumed active operations at their Jackson, Mich., plant, owing to the improvement in the demand for their leading specialties. They have started the works with about 20 molders and such other help as are needed to take care of their work.

A PAMPHLET of oblong shape, issued by Kruse & Dewenter, Indianapolis, Ind., is entitled "A Treatise on the Kruse & Dewenter System of Warming and Ventilation for Buildings both Public and Private, and the Latest Improved Sanitary Dry and Flush Closets." In an introductory note they call attention to the fact that they have been engaged in the manufacture of warming and ventilating apparatus since 1866, and find it necessary to publish a new book every two or three years to keep the public informed of the improvements they have made. This latest volume begins with a general treatise on ventilation, transmission of heat, combustion of coal, air, ventilation required and principles of ventilation, this being followed by a specific explanation of the Kruse & Dewenter system. The illustrations of large size are colored and show very vividly the system of ventilation employed, the direction of air currents, the air passages, &c. The closets are similarly explained and illustrated, while later in the volume the furnaces are shown by means of various sectional and broken views. A number of different varieties of Monarch, Peerless, Perfection, Mogul, Globe, Solar and other furnaces of their manufacture are referred to. At the close of the volume are illustrations of prominent buildings, churches, public schools, &c., in which the Kruse & Dewenter systems are employed.

THE JOLIET STOVE WORKS of Joliet, Ill., issue their customary monthly calendar in the shape of an attractive blotting pad embellished with a design showing a large water lily fully opened and resting upon the surface of the water, while projecting from the center of the lily are to be seen the head and fore legs of a frog. The calendar for June occupies a little square in the upper right-hand corner of the blotter, while the remaining space refers to Moore's air tight heater, the improved 1895 design of which is said to be "a beauty."

THE CENTRAL STOVE WORKS of Lebanon, Pa., were sold on Friday afternoon, May 24, by Sheriff Stine, to William Beyerle of the place named. The sale covers the patterns, stoves, molds and, in fact, everything but the building itself. We understand that the purchaser has not made up his mind whether he will operate the works or offer them for sale.

THE BELLAIRE STOVE COMPANY of Bellaire, Ohio, are meeting with a good demand for their leading specialties, and state that business is better just now than during the same period last year.

RECENT advices from Southeastern Massachusetts are to the effect that the Century Stove Company of Dighton are running their works four days a week.

THE PHILLIPS & BUTORFF MFG. COMPANY of Nashville, Tenn., have been meeting with a very gratifying demand for their specialties, and one of the Chattanooga papers is authority for the statement that one day, not long

ago, the company received orders from Texas for 461 stoves, from California for 296, from Georgia for 176 and small orders from other States aggregating nearly 200 more.

GIBLIN & Co. of Utica, N. Y., are distributing circulars descriptive of their leading furnaces, the merits of which are fully set forth in a way to interest the dealer, while broken views give an idea of the internal construction. The circulars relate to the Standard Smokeless furnace, which is designed, it is claimed, not only to burn soft coal, but to "burn it without smoke, gas or explosion;" the Standard Junior, which is made in several sizes, with diameter of fire pot ranging from 21 to 29 inches inclusive; the Rival Junior, made in four sizes; the Standard steel furnace, which is offered in five sizes, and the Rival, made in four sizes.

THE ELLWOOD CITY GAS STOVE & STAMPING WORKS recently turned out 1768 new stoves in a week, being the largest week's work since the plant was started. A large new addition will soon be built and the working force increased.

THE RICHARDSON & MORGAN COMPANY of New York City early in the week filed articles of incorporation with the Secretary of State, the capital stock being given as \$100,000. The directors are J. J. Richardson, Ernest A. Williamson and J. A. Richardson of New York City. The company will manufacture stoves, furnaces and cooking and heating apparatus.

THE EXCELSIOR MFG. COMPANY, St. Louis, are busily engaged on their 1895 catalogue, which will be ready to be sent to the trade on or about July 15. It will contain a number of new goods, prominent among which will be their Charter Oak steel range, which is now fast nearing completion. An air-tight heater with cast top and bottom and cast door will also be shown. Circulars of this latter stove are now being sent to the trade upon application.

THE SCHUYLKILL VALLEY STOVE COMPANY, Spring City, Pa., will this season introduce a new sheet iron single and double heater in two sizes. They have remodeled several of their ranges, new bases being the principal feature in the changes.

FLOYD, WELLS & Co., Royersford, Pa., have just contracted for the erection of two wings to their main building 76 x 78 feet and 75 x 60 feet respectively. The wings, when completed, will be utilized for an extension of the molding shop, and are expected to accommodate about 35 molders. Among the new goods which the firm will put on the market this season will be a square heating stove, with nickeled corners, nickeled swing cover, foot rails and base, large ash pit, and nickeled finish bronze urn. They have redressed their Star Rosemont parlor heater, it now having a full nickeled section top and swing cover, and full nickeled base, side rails and name plate.

WE HAVE RECEIVED, with the compliments of the Phillips & Clark Stove Company, Geneva, N. Y., an advertising novelty which they are distributing among their friends in the trade. It consists of a card case made of black leather, finely finished and well made. Upon the inside of one flap of the case and printed in old gold letters is the inscription: "Compliments of Phillips & Clark Stove Company, Manufacturers of Andes Stoves and Ranges, Geneva, N. Y." The character and quality of the card case are such as to insure its preservation by the recipient, and it is excellently designed to serve the purpose for which it is issued. We

also have from the same company another novelty bearing a *fac-simile* of the company's trade-mark in old gold. It is either a pouch for tobacco or for carrying loose change, as may be preferred, evidently the latter use being the most appropriate. It is of tan-colored leather and closes with a twist which insures safety to the contents.

M. THATCHER, at his new show-rooms on Beekman street, is showing the Ellwood gasoline stoves made by the Ellwood Gas Stove & Stamping Company, Ellwood City, Pa. One of the features of the stove is the arrangement of a double burner under an oblong grating at one end of the stove, which is used in connection with an oven for baking and gives a very powerful burner for other cooking work.

THE DETROIT STOVE WORKS, Detroit and Chicago, have enjoyed an excellent run of orders for their gas ranges the past spring. This is their second season in the gas range line, and their success shows that the foundation for a good trade was well laid last year. They have had a good business in Chicago as well as in the cities and large towns generally throughout the Northwest. The range, as made for this season, is most handsomely dressed, much attention having been paid to the design adopted in molding the frame and nickel having been used freely in the decorations. The burners used are of the company's own design and have proved very satisfactory. They are drilled, with a circle of holes forming the center, from which arms radiate in star shape. The usual objection to drilled burners, namely, popping, has been completely overcome. Two sizes of ranges are made, 16 and 18 inch, with or without water heaters, high broiling ovens, high warming closets, &c. A number of new goods are now being brought out for the fall trade in standard cooking and heating apparatus.

HORTON, GILMORE, McWILLIAMS & Co., 172 to 176 Lake street, Chicago, are anticipating a large trade on Cole's air tight stove, for which they are exclusive sales agents in Indiana, Illinois and part of Michigan and Wisconsin. The manufacturers have made considerable improvements in the stove for this season. They have added a line with a nicked swing top, and have also made the entire top of cast iron, thus securing both greater durability and a much more attractive appearance. The line with cast top can now be shipped with two sizes nested together, thus effecting a saving of freight. An air tight coal stove has also been brought out, having a steel body, removable cast top and cast fire pot and grate which can be removed through the top. It is furnished with a hot blast draft, designed to assist in securing more perfect combustion. The manufacturers make very strong claims for this stove.

WILLIAM RESOR & Co., Cincinnati, Ohio, will offer a new air tight heater with some special features in its construction, and in three sizes, the coming season, and their Monitor parlor base heater for wood will be put out with a new dress. Some important changes have also been made in the outward appearance of their front sheet flue and hot blast draft Monitor base burner, which will doubtless prove of interest to the trade. The internal construction whereby the greatest portion of the heat is radiated from the front of stove instead of the rear, as is the case with the ordinary base heater, and the hot blast draft whereby perfect combustion and absolute control of the fire at all times is maintained, having given such universal satisfaction, will not be changed in any

manner. This stove is made in three sizes, and two sizes with double heating attachment. A new catalogue, illustrating and describing the company's entire line, is now in the hands of the printer and will be ready for distribution within a few weeks.

HESS, SNYDER & Co., Massillon, Ohio, will shortly place upon the market a new air-tight heater, under the name Success Broomer, for which are claimed many points of superiority, the fire pot having the same principle of construction as the fire bowl in their Broomer furnace; they also are bringing out a gas and smoke consuming device similar to the latter, of which but one size will be made this season.

THE new open Franklin, the Gem Franklin and the new Red Oak stoves recently brought out by Shinnick, Woodside & Gibbons of Zanesville, Ohio, are reported as meeting with a phenomenal demand.

THE INDIANA STOVE WORKS, Evansville, Ind., are operating their establishment on full time, and are busily engaged in getting out an entire new line of wood cooks under the name of Ideal Darling, which will embody all the latest improvements. A new catalogue is also in the printers' hands, which, it is expected, will be ready for distribution about the 20th.

WM. G. SEMPLE has severed his connection with the stove house of S. Faith & Co., and will take a position with the Philadelphia Stove & Iron Foundry Company, with whose goods he is thoroughly familiar, having previously spent several years in the latter company's employ. He reports that they have a handsome double oven range, and that the Clover Triumph range for builders' use is increasing in popularity. Their Triumph and Domestic heaters are finding favor with the builders. Robert Patton looks after the interests of this house among the building trade and is booking some satisfactory orders.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

JOHN W. DANFORTH bid \$2375 and secured the contract for heating and ventilating the West Avenue School Building at Lockport, N. Y.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until June 25 for a low pressure circulation steam heating and ventilating apparatus for the United States Court House, Post Office, &c., building at Charlestown, S. C. Drawings and specifications may be had from the Supervising Architect, Washington, or of the Superintendent at Charlestown.

YOUNGSTROM & WELSH of Phoenix, Ariz., announce they have received what they claim is the largest plumbing contract that has ever been let in the territory. They have the contract for the plumbing and fitting of the new Ford Building, which amounts to \$2800.

A. B. SPROUL has the contract for the plumbing in the new building of the Adamant Plaster Company, New Haven, Conn.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until June 20 for the steel skylight, framing, roof over mailing platform, steel vault lining, &c., for the United States Post Office Building, at Washington, D. C. Drawings and specifications may be had from the Supervising Architect or from the Superintendent at Washington.

CURTIS & BENNER, Red Hook, N. Y., have the following contracts for heating the new De Peyster Home for Consumptives, at Verbank, using two Boynton

steam boilers, and for the roofing, using Cortright's Victoria metal shingles; the tinning, plumbing and heating for a \$10,000 residence for the Misses Martins, using a Boynton hot water boiler. They also have the contract for the tinning work for the \$7000 residence of Dr. R. G. Carroll.

J. S. CRAIG, Hartford, Conn., is overhauling the plumbing in Walter Keeney's residence and C. R. Powers' house.

LANGDON & DALEY, 630 Main street, Hartford, Conn., are enjoying a very busy season. Among the many contracts of cupping their attention at the present time are: A six-tenement house on Whitman court, a two-tenement house on Kenyon street and a six-tenement house on Florence street, all for Theo. Newton; a two-tenement house for Chas. Stone; a two-tenement house for Mr. Collins; three two-tenement houses for George Clark; a two-tenement house for F. Loescher; also a hotel in Simsbury.

THE ARNOLD COMPANY, New Haven, Conn., have obtained the contract for the plumbing of F. C. Cannon's two-family houses. The plumbing will be first class, including lavatories, baths, &c. The Fossett & Bishop Company have the heating.

DONOHUE & BERTILSON, Bridgeport, Conn., have the contract for the plumbing in the new house being erected by J. Lattin.

HENRY GREELEY is to build a fine residence at Hartford, Conn. It will have a modern plumbing system and will be heated with furnaces.

JAMES F. DUFFY, Hartford, Conn., has a contract for the plumbing in a \$5000 residence for Miss Julia Langenham.

D. M. SHEEHAN, New Haven, Conn., has a contract for the plumbing and hot water heating in a new building for Adam Kidinger.

PROPOSALS are wanted until July 19 for rebuilding, heating and ventilating the High School Building, at Cleveland, Ohio.

THE BOARD of Education of Cedar Rapids, Iowa, at a recent meeting, awarded the contract for heating and ventilating a new school building to the Peck-Williamson Heating & Ventilating Company, Cincinnati, Ohio.

THE CONTRACT for the steam heating plant for the Lincoln Institute, at Jefferson City, Mo., will be awarded June 14.

FRED DAMM is putting the heating apparatus in the school building at Carmelton, Ind.

JOHN BAIN, 1609 Sixty-third street, Chicago, has the contract for the plumbing and drainage in the flat building of H. Goodman, Forty-seventh street and Armour avenue.

CLAYTON & MILLER, 477 West North avenue, Chicago, are to do the plumbing and drainage in the residence of O. H. McElden, 913 Jackson boulevard.

FRANK MEER, 485 West Eighteenth street, Chicago, has the contract for the plumbing and drainage in the flat building of Frank Kolenka, Twelfth place.

M. F. BARRETT, Chicago avenue and Paulina street, Chicago, is to do the plumbing and drainage in the flat building of B. Legen, 500 West Chicago avenue.

J. STEWART, 6506 Wentworth avenue, Chicago, has the contract for the plumbing and drainage in the flat building of H. J. Houghton, 6600 Wentworth avenue.

DAVEY & SCHUMACHER, 454 Lincoln avenue, Chicago, are to do the plumbing and drainage in the flat building of J. Biebel, 1713 Diversey street.

MORRIS BROS., 3442 South Halsted street, Chicago, have the contract for the plumbing and drainage in the residence of Edward Witschrock, 5753 Paulina street.

J. CONRATHS, 5900 Princeton avenue, Chicago, has the contract for the plumbing and drainage in the apartment building of F. P. Burket, Forty-seventh street and Burley avenue.

J. E. HEDMAN, 656 West Division street, Chicago, is to do the plumbing and drainage in the apartment building of C. J. Anderson, Davis street, near Potomac avenue.

DORE & SON, 1042 West Van Buren street, Chicago, have the contract for the plumbing

ing and drainage in the flat building of Charles Barnett, 1638 Greenshaw avenue.

W. P. BOLTE, 5117 Dearborn street, Chicago, is to do the plumbing and drainage in the flat building of E. F. Dyar, Fifty-fourth court.

WILLIAM F. JOHNS, 887 West North avenue, Chicago, has the contract for the plumbing and drainage in the flat building of M. Lundahl, 888 North Fairfield avenue.

THE CARTON FURNACE COMPANY, Utica, N. Y., have been awarded the contract for heating and ventilating the new Francis Street School Building, at Utica.

HUSSEY & EDWARDS, Revere, Mass., have the contract for heating the Town Hall.

CHRIS. ALLEN, El Dorado, Kan., is arranging the water closets in the Court House.

The Crosby Gang Slitting Machine.

A new machine, illustrated herewith, has been brought out by G. A. Crosby & Co., 176 South Clinton street, Chicago. It is specially designed for the use of manufacturers of cans for fruit, meats, &c., or for any one desiring to cut light sheet metal into uniform rectangular blanks. It is constructed with direct reference to rigidity and strength. The shafts are provided with hard forged boxes, accurately fitted, and are of forged steel, made unusually heavy and strong to guard against the liability of getting out of true or springing, as the slightest variation in the shafts would ruin the nice adjustment of the cutters.

balanced idler hung on springs so arranged as to straighten the sheets as they pass into the cutters. The cutters may be ground without removing them from the machine or altering their adjustment by use of the grinder, which the manufacturers furnish when desired.

The machine is provided with an adjustable bar which is not shown in the cut. This prevents the dropping and twisting of the blanks as they pass out from the cutters. The weight of the machine is about 1000 pounds. It will trim and split or slit sheets $2\frac{3}{4}$ inches wide.

A French photographer has recently been able to photograph objects under water. His apparatus consists essen-

The Crosby Gang Slitting Machine.

THE Committee on Public Property, Gloucester, Mass., have awarded the contract for furnishing heating and ventilating apparatus for the new school house at Magnolia, to L. E. Smith & Co.

THE CONTRACT for plumbing the Greeley Street School Building has been awarded to Owen McAuliffe, Providence, R. I., who will also do the plumbing in the new school building on Ruggles street. The contract for the heating apparatus has been awarded to the Worcester Steam Heating Company.

I. F. GRUMBINE of North Ninth street, Lebanon, Pa., has secured the contract to place in the new school building to be erected at Myerstown a Howard heating furnace.

Several of the London districts are contemplating the establishment of the public automatic hot water system now in use in certain parts of Paris, by which the residents can obtain a supply of hot water by the coin-in-the-slot system.

Each shaft is provided with a pulley which necessitates one cross and one open belt. This arrangement allows the adjustment of the shafts so as to bring the centers of the shafts closer together when the cutters are reduced in diameter by grinding, thereby saving the trouble of recutting or readjusting gears.

The cutters are made very broad and heavy, of the best steel. Between every two sets of cutters there is a specially prepared elastic roll which runs against a similar roll on the opposite shaft. These rolls are held in place by hubs to which are attached the cutters. This arrangement does away with the annoyance experienced heretofore from the front and back feeding rolls, which, if there is the slightest variation or irregularity in the stock causes it to twist and thus be cut out of true, spoiling the stock.

The roll in front of the cutters is a

tially of a barrel filled with oxygen, surmounted by a glass bell which holds an alcohol lamp. By means of a mechanical contrivance, powdered magnesium is thrown on the flame of the lamp, which flares whenever a view is taken. The equilibrium of the barrel is preserved by means of suitable vents in the bottom which admit water as the oxygen diminishes. Very clear and beautiful photographs taken on the very bed of the Mediterranean have, it is said, been obtained in this way.

A professor of the University of Pennsylvania, who has recently returned from a journey in the Orient, has brought with him a complete Buddhist temple and accessories, the whole weighing about 6 tons. It is to be erected in Philadelphia, and will be the only temple of Buddha in the United States.

TRADE REPORT.

The Iron Market.

Reports from all the leading centers uniformly record either actual advances or a rising tendency. In fact, the pace is getting so hot in some districts that the conservative element is growing nervous of a possible set back. A good many sellers in different branches of the trade are refusing to quote beyond next month because they prefer to await developments. This is particularly true of the rolling mills, whose product has not yet caught up with the advance in raw material.

The advance in prices has put a quietus on the embryo export trade in many lines, and for a long time to come little will be heard of the exultation of the earlier days of the year. It will echo along probably in the wise editorials of economic writers, in stump speeches and in the halls of Congress.

The only really valuable trade which we did capture, modest though it be, taken altogether, is that of Canada. We doubt whether serious sacrifices will be made to hold it for the present. When it is wanted again low prices will be the relentless method for recapturing it. In some branches like the Wire trade we are fast approaching the point again when it will pay to buy foreign Wire Rods for the export trade under drawback.

The methods of the Tack Association are now in full operation with the Wire Nail and the Cut Nail industries, and prices, particularly for the latter, have been keyed up very considerably. A spell of prosperity is a startling and possibly intoxicating change after years of abject misery.

The Southern Pig Iron makers have put up prices another 25c. per ton for the third quarter, making the total advance 75c. from the lowest point. The market has been quite active in Cincinnati and in Chicago.

Pig Iron.—The New York market has been fairly active, but it is evident that a number of buyers still have little faith in the permanence of the advance. This is due chiefly to the fact that their own business has not as yet shown much improvement. Another advance of 25 cents has been decreed by the Alabama makers. The Virginia furnaces are again getting into shape, many having been banked by the Pocahontas strike. We quote \$12.25 to \$12.50 for No. 1; \$11.25 to \$11.50 for No. 2, and \$10.75 to \$11 for No. 2 Plain, and \$10.25 to \$10.50, Northern brands, tidewater delivery. Southern Iron, same delivery, is selling at \$12 to \$12.25 for No. 1; \$11.25 to \$11.50 for No. 2; \$10.75 to \$11 for No. 3; \$11 to \$11.25 for No. 2 Soft, and \$11.25 to \$11.50 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$10.50 to \$10.75.

Advices from Philadelphia indicate that the Pig Iron market retains all the strength and buoyancy noted in recent reports. Prices are not notably higher, but the average of sales are at about last week's prices, with a probability that still better figures will rule in the near future. Some furnaces

have stopped quoting, on the ground that they have sold all that they ought to sell, and until they can see more clearly in regard to the course of events during the fall months they prefer to hold themselves open to whatever may turn up. Buyers are anxious to place orders, however, and a large business is being done. Foundry grades are in heavy demand, with sales at from \$11.65 to \$11.75 for No. 2 X, although in a few cases \$11.50 is said to be quoted. The general tendency is toward higher figures, and it is believed that another revision of quotations will be necessary before long. Meanwhile fair average prices are about as follows:

Standard No. 1 Foundry X.....	\$12.00 to	\$12.50
Standard No. 2 Foundry X.....	11.50 to	11.75
No. 2 Plain.....	11.00 to	11.25

The market for local Coke Iron in Chicago is quite active, yet contracts recently placed have in very few instances called for round lots. It now looks as if prices will be higher before many days. Manufacturers are merely considering the question as to whether it will be advisable to make any material advance until they are thoroughly satisfied that no danger exists of the demand being checked. Southern Iron is higher and local Iron could easily be put up another notch. Many large consumers have not yet covered their requirements for the future, and when they come in another great element of strength will be added to the situation. A moderately good trade is reported by sellers of Southern Iron, which is limited by the scarcity of some grades. Prices have been advanced 25c. on an average to cover deliveries for the next three months, and 25c. more for deliveries beyond that time. Quotations are as follows, for cash:

Lake Superior Charcoal.....	\$13.00 to	\$13.50
Local Coke Foundry, No. 1.....	10.50 to	10.75
Local Coke Foundry, No. 2.....	10.25 to	10.50
Local Coke Foundry, No. 3.....	9.75 to	10.25
Local Scotch No. 1.....	10.50 to	11.00
Ohio Strong Softeners, No. 1.....	12.75 to	13.25
Southern Silvery, No. 1.....	12.25 to	12.50
Southern Silvery, No. 2.....	11.75 to	12.00
Southern Coke, No. 2.....	10.75 to	11.00
Local Coke, No. 3.....	10.25 to	10.50
Southern, No. 1, Soft.....	10.75 to	11.00
Southern, No. 2, Soft.....	10.50 to	10.75

In the Pittsburgh district the belief in the trade that higher prices on Coke will prevail after July 1 has been strengthened by the appearance of the leading Pig Iron maker in the market as a buyer, during the past week, of Bessemer Pig for delivery in July and August. Purchases of some 50,000 tons of Bessemer are reported to have been made by the concern in question. The appearance of this concern as a buyer has done much to strengthen the market, and the fact that several Valley furnaces will go on Foundry in a short time is also having its effect. Foundry Iron is in fair demand, but has not responded in the same degree to the higher prices ruling as have Bessemer and Gray Forge. We quote as follows:

No. 1 Foundry.....	\$11.00 to	\$11.25, cash
No. 2 Foundry.....	10.50 to	10.75

The situation of Pig Iron in the Cincinnati market is one of extreme strength. Large orders have been received by both Northern and Southern furnaces and prices of all grades

have been advanced. Southern producers have instructed agents to advance prices 25c. per ton, which makes a total advance of 75c. per ton from the lowest point within the past few months. In fact, at the close the policy of both Northern and Southern furnaces is to place such prices upon various grades as to preclude further large sales. The orders already taken have been heavy. Most of the Southern furnaces now running are either unable or unwilling to increase the present capacity, and even if there was a disposition to run fuller, it is doubtful that the furnaces could be put into paying working condition under several months' time. Quotations are given as follows:

Southern Coke, No. 1.....	to	\$10.25
Southern Coke, No. 2.....	to	9.75
Southern Coke, No. 3.....	to	9.50
Southern Coke, No. 1 Soft.....	to	9.75
Southern Coke, No. 2 Soft.....	to	9.50
Ohio Soft Stone Coal, No. 1.....	14.50 to	15.00
Ohio Soft Stone Coal, No. 2.....	14.00 to	14.50
Lake Superior Coke, No. 1.....	11.75 to	12.25
Lake Superior Coke, No. 2.....	10.75 to	11.50
Hanging Rock Charcoal, No. 1.....	to	11.00
Hanging Rock Charcoal, No. 2.....	to	10.50
Hanging Rock Charcoal, No. 3.....	to	9.50
Tennessee Charcoal, No. 1.....	13.00 to	13.50
Tennessee Charcoal, No. 2.....	12.00 to	12.50

The demand for Pig Iron in the St. Louis market is increasing and bids fair to continue, especially as consumers realize the fact that the recent advance is legitimate and will be strictly adhered to by the furnaces. On Thursday of last week another advance of 25c. per ton went into effect, making the price of No. 2 Foundry \$10.25, f.o.b. cars St. Louis. Sales are not particularly heavy but are larger than for previous 30 days, and what they lack in size is made up in quantity. The demand for Foundry and No. 1 Soft is particularly heavy at this time, and furnaces are unable to keep their stocks of these grades in any kind of respectable shape. We quote as follows for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry.....	\$10.75 to	\$11.00
Southern Coke, No. 2 Foundry.....	10.25 to	10.50
Southern Coke, No. 3 Foundry.....	10.00 to	10.25
No. 1 Soft.....	10.25 to	10.50
No. 2 Soft.....	10.00 to	10.25

Metal Market.

Pig Tin.—The downward course of prices has not been arrested nor has the weakish undertone of the market shown any sign of healing. Prices have not declined during the period under review as much as they did in either of the preceding three weeks, but the tone is quite as soft, since buying interest continues to be exceedingly tame, not only in speculative quarters but among the outside trade. The consumptive demand has been merely moderate. The decline in prices and hesitancy of buyers is attributed in good part to the monthly statement, showing an increase of 1793 tons in the visible supply for Europe and American, making the total 25,671 tons, or enough for five months' consumption. Weak Singapore cables have also had more or less unfavorable influence. The price of small lots of Straits Pig from store is quoted at 15½c. to 16c. per lb.

Copper.—Dealings have been on a somewhat smaller scale in the past week and the market at one time seemed to have lost some of its buoyancy. On Tuesday there was freer offering, with lower prices made and surface indications of something in the nature of a "bear" movement. This movement turned out to be an effort at manipulation, apparently to effect the London market, and was measurably successful. Later in the week, however, the market reacted to its former higher level. A very fair business has been done in Lake Ingot as well as in Electrolytic and Casting Copper for consumptive purposes. For small lots of Lake Ingot from store, quotations are firm at 1½c. and of M. C. B. at 10½c. to 10¾c. per lb.

Sheet Copper.—The market for Manufactured Copper increases in firmness under advancing prices in raw materials and a healthy consumptive demand. All the mills are busy, and consumers evince an increasing tendency to require prompt shipments. The outlook generally is for brisk business in Cornice Copper as the numerous buildings now under construction progress toward completion. Prices are decidedly stiffer, and it is considered likely that a general advance in the list rates for manufactured Copper will be inaugurated before long if the present advance in raw material continues. Small lots of Sheet Copper from store are quoted at the net list price of 14c. per lb., and this price has been paid on some large orders where prompt delivery was necessary.

Pig Lead.—A decided change has taken place. Higher prices by cable and favorable prospects for export business acted as an offset to the "bearish" features that upset the market for a time last week, and a more decided stand taken by Western producers also had some influence. Transactions here have not been heavy, yet of sufficient volume to carry wholesale prices up to 3.30c. In the smaller jobbing business the movement has been very fair and prices have remained firm. Jobbers ask 3½c. to 3¾c. per lb. for moderate sized lots of American Pig.

Lead Pipe.—Considerable improvement is manifested in the demand for these materials. The requirements of consumers, both for current use and for stock, have shown a notable expansion during the past week, and the outlook for a liberal business during the coming months is considered bright. Manufacturers are busy on orders and prices of Manufactured Lead have stiffened, although the list rates in this section have not yet been advanced. With the recent rise of raw material, however, it is regarded as probable that the list may be revised at an early date. Lead Pipe in small quantities from store is quoted by jobbers 5½c., and Sheet Lead at 6½c., subject to the usual discount.

Spelter.—Dealings have been only fair in volume, and individual transactions involving more than two or three carloads were strictly the exception. The position of supplies at primary points and the attitude of producers have, however, brought about a further advance in wholesale prices. The smaller trade has shown considerable activity and the demand from galvanizers has been brisk. The current rates for small lots of good Western brands from stock rule at about 4½c. per lb.

Sheet Zinc.—A scarcity of this material still prevails. Shipments from the mills are not obtainable with any

promptitude. Prices remain high and depend largely on the necessity of the buyer. The average rate for 600 lb. casks runs at 6.50c. and for smaller lots at 7c. per lb.

Antimony.—There has been little doing outside of routine trade. Prices remain at about 9c. for Cookson's, and 8c. for Hallett's in small parcels.

Nickel.—Sellers' figures remain at 35c. to 40c., according to quantity and terms.

Tin Plate.—Buyers' operations have been rather tame. In the larger scale of business the only movement is in spot purchases of cokes for canners' use, in which some good sized transactions have been recorded. Aside from this dealings have not exceeded large retail proportions. Very few orders for future deliveries have been placed during the week and business in this line has proved decidedly disappointing. Jobbing business, however, has been very fair and sufficient to keep prices quite steady at last week's level. In fact, an advance is asked in the case of certain grades of imported Plates, which are scarce at the present time, otherwise the Tin Plate market has not yet responded to the generally advancing feeling in the metal markets. American Ternes are moving freely in a retail way. The domestic works are all more or less busy on orders, and some of the leading manufacturers will not quote for early deliveries at all, while in some cases they ask on shipments for July, August and September an advance on present rates. The general tone of the market is firm.

A special London cable dispatch of June 5 to the *Iron Age* reports on the British Tin Plate market as follows: Tin Plates have been quiet. Business of a holiday nature and mostly in small lots for immediate delivery. There is more demand for Ternes and some good American orders have been received. There is a better demand for Black Plate, but prices are unchanged. Stock at shipping port about 174,000 boxes. Prices, f.o.b. Wales, are as follows:

Bessemer Cokes, 10 14 x 20 9s. 3d. to
 Siemens Cokes, 10 14 x 20 9s. 4½d. to 9s. 6d.
 Ternes, 20 x 28 18s. to 22s. 6d.
 Charcoals, 10 14 x 20 11s. to 13s. 6d.

Sheet Iron.—One of the largest makers has sent out notices to the trade of a further advance in Galvanized Sheets, and they are expected to go still higher before long. Sheets can hardly be had at any price just now, the mills being crowded with work and away behind in deliveries. Some mills decline to quote and others quote for immediate acceptance only. Most are refusing to name prices for delivery beyond July 1, preferring to wait the outcome of the conference on the wage scale. In a few cases where August deliveries are quoted on it has been at a substantial advance over current prices. The demand for Galvanized Sheets in this district is active and not easy to fill. Black Sheets also come in for a good share of attention by consumers. Black Plates for tinning purposes are in particularly brisk request by dipping concerns, some of which have been considerably hampered in their operations lately by the difficulty in obtaining sufficient material to work on. Small lots of Galvanized Iron from store are still quoted by jobbers at 75 per cent. off, and of No. 27 Common Iron at 2.80c per lb.

THE STEAM AND HOT WATER HEATING TRADE will be interested in the an-

nouncement in another column made by Edward P. Bates, Syracuse, N. Y., relating to Standard Flange Schedules. The schedule of Standard Flanges as prepared by the American Society of Mechanical Engineers, the Master Steam and Hot Water Fitters' Association and a committee of the leading Valve and Fitting manufacturers of the United States, is now on sale and can be obtained from Mr. Bates.

Chicago Report.

Scrap.—Trade is looking much better. Dealers quote their buying prices as follows, Chicago delivery:

	Per net ton. Per lb
No. 1 Wrought Scrap.....	\$7.50
Machinery Cast.....	6.00
Malleable Cast.....	6.00
Stove Plate (free of burnt)...	4.90
Burnt Iron and Grate Bars.....	2.50
Sheet Iron and Hoops.....	2.00
Plow Steel and Breaking Stock.....	3.00
No. 2, such as Shovels, Hoes, &c.....	2.50
Old Boilers—whole (Iron).....	3.00
" (Iron)—cut in single Sheets and Rings.....	5.00
Old Gas-Pipe and Boiler Tubes.....	5.00
Cast Borings.....	3.25
Turnings.....	4.00
Horseshoes.....	8.00
Copper Wire and Heavy.....	8
Copper Bottoms.....	7
Copper Clips.....	7½
Heavy Brass.....	6½
Light Brass.....	8½
Pipe Lead.....	2½
Tea Lead.....	2½
Zinc.....	2½
Rubber.....	4

Anthracite.—The country trade is improving. Carload lots of 12 net tons or over are quoted as follows

	Egg, Sto. Grate, and Ch.
Chicago, Ill.....	\$4.00 \$4.75
Milwaukee, Wis.....	4.60 4.75
Kansas City, Mo.....	7.80 7.95
Council Bluffs, Iowa.....	7.80 7.95
Lincoln, Neb.....	7.95 8.10
Sioux City, Iowa.....	7.80 7.95
Aberdeen, S. Dak.....	7.85 8.00
Dubuque, Ia.....	8.90 6.05

THE PENNSYLVANIA WIRE WORKS, Edward Darby & Sons, Philadelphia, Pa., have just issued an illustrated catalogue and price-list of 122 pages, devoted to Brass, Copper, Steel, Iron and Galvanized Wire Cloth, Wire Window Guard and Wire work of all kinds, Wrought Iron and Brass Grilles for all purposes, Radiator, Nursery and Spark Guards, Roof Crostings, Window and Door Screens.

BERTHA ZINC & MINERAL COMPANY, whose New York City office is at 30 Burling slip, report a very active business in their special brand of pure "Bertha" Spelter, used for fine castings. The company's smelting works, located near Pulaski, Va., are running to their full capacity.

CONDITION OF THE

Hardware Trade.

THE MARKET is characterized by the same general features as for the past week or two. There is continued firmness in Iron and Metals, and a stronger tone in the heavier goods in which the raw material is an important part of the cost. There has been, accordingly, in several such lines a withdrawing of extreme prices and in some cases the announcement of advances. There is, however, a good deal of conservatism in this matter on the part of manufacturers, as they are disposed to hold back announcements of higher prices until pretty well assured that the future course of the market is going to justify such action. It is recognized that premature advances while causing a temporary improvement in the general tone, are unwise, as the reaction, if it should come, is likely to be injurious. The care which manufacturers are, therefore, exercising is to be commended, especially as in some directions there is something of a tendency to overestimate the necessity for making higher prices, and the impression prevails that in some cases this matter has been overdone. At the same time it is to be remarked that manufacturers generally who are making lines of goods not so directly affected by the higher price of raw material are disposed to refuse to accept heavy orders at present prices, and some of them are wisely withdrawing the lowest prices at which only a short time ago they were willing to sell. It is recognized as probable that prices on many goods will be higher with the increased cost of the raw material and perhaps advanced wages. There is certainly a disposition on the part of the large trade to buy much more freely than for a long time.

The advances which have recently occurred, many of them on lines of goods in which the jobbers had an opportunity to cover their requirements, have certainly given the market a perceptibly better tone and the jobbers are thus afforded an opportunity to realize a handsome profit on many goods. It remains to be seen to what extent they will improve the opportunity of realizing a profit for themselves and at the same time help the general tone of the market. In the past it has too often been the experience of the trade that goods purchased prior to an advance have been to a large extent used to undersell the manufacturers, and it is to be regretted that there are indications in several lines that this is still being done to some extent. This is certainly a matter which is deserving the most careful attention of the jobbing trade, and the subject might appropriately have a prominent place in the questions considered at the conventions of the different organizations representing the jobbing trade. With the indications of general improvement the wholesale merchants, through whom so considerable a proportion of the retail trade obtain their goods, have an opportunity which, it is to be hoped, will not be disregarded.

Advices from Chicago.—The orders for Shelf Hardware are increasing in size, making volume of business larger than during the previous weeks. Trade would be much heavier if country merchants were not so distrustful of the advances which they are asked to pay. They have so long been accustomed to a falling market immediately following some slight upward movement, that they are apprehensive of a similar condition of things this summer. Nevertheless they are obliged by their increasing trade to

purchase larger quantities of goods. Jobbers are expecting higher prices on small goods after July 1, when a number of new lists will be out. Manufacturers are now finding it an easy matter to get together on prices. Old troubles are disappearing and long standing fights are being ended. A new list is out on Strap and T-Hinges, and they are now likely to be considerably dearer with the closer relations existing among manufacturers. Tin Plate is very active and firm, with no change in prices thus far, but with conditions ripe for an early advance.

Notes on Prices.

Wire Nails.—During the past week the arrangement between the manufacturers of Wire Nails has been in operation and the trade have had an opportunity to become familiar with the working of the plan so far as it has been developed. As a result of the fact that all the prominent makers of Wire Nails are thus associated in a strong organization the tone of the market is decidedly firm and orders have been placed very freely at the advanced prices. This is owing to the fact that the trade generally regard the new arrangement with confidence in its stability, and anticipate that the manufacturers will be able to control the market. Prices for June continue without change. Small lots from store in New York are regularly quoted at \$1.55 base, and from dock, \$1.51. A good many parties are taking advantage of the provision by which a rebate of 5 cents per keg from the carload price is made to those who purchase 1000 kegs during the present month, especially as the impression prevails that production during July will be considerably curtailed in order to give the mills an opportunity to take account of stock, make necessary repairs and at the same time avoid an undue accumulation of Nails. In accordance with the policy adopted a meeting of the committee in charge will be held within a day or two with a view to considering the price which should be determined upon for July. The impression prevails that a further advance will be announced on Nails in kegs and also on the miscellaneous list goods. The arrangement for the protection of the jobbing trade is generally regarded as satisfactory and giving them as wide a margin as they will be likely to retain.

Advices from Chicago.—The Wire Nail situation is very strong. Manufacturers are already withdrawing the new quotations, although the month is not a week old; several of the largest mills cannot at present take any more orders, having all the business they are in a position to handle. The prospects favor still higher prices in a few days, owing to the strength of the market. Raw material is dearer, and this in conjunction with the good demand is expected to force values to a higher level than the present carload rate of \$1.35, Chicago. Jobbers quote small lots from stock at \$1.40.

Cut Nails.—The Cut Nail market is very firm and there has been an important advance since our last report. The manufacturers have an organization similar to that of the Wire Nail manufacturers and are apparently in excellent position to control production and prices. They are making quotations only for the month of June and refuse to accept orders for delivery later than the 30th inst. Carload lots on dock New York are held at \$1.30 base, and

small lots from store in New York at \$1.40 base.

Advices from Chicago.—Manufacturers of Cut Steel Nails have advanced prices to \$1.30, Chicago, for carload lots of 60 cent average. This price is named only for June delivery, the same policy having been adopted as in the case of Wire Nails. Jobbers quote small lots from stock at \$1.25.

Barb Wire.—In sympathy with the general tone of the market Barb Wire is held firmly. Manufacturers are generally indisposed to make concessions from this figure.

Advices from Chicago.—Conditions have not changed in the Barb Wire trade. The factories are full of work and prices are very firm. It is expected that the Barb Wire manufacturers will shortly get together and that this trade will be put in a stronger position for fall business. Jobbers are selling small lots of Painted at \$1.70 and of Galvanized at \$2.05.

Wrought Iron Pipe.—There is a good deal of activity in Wrought Iron Pipe and many inquiries. Some large orders have recently been placed and the manufacturers are generally well occupied. The tone of the market is firm and outstanding extreme prices have been withdrawn and in some cases advances made on both Plain and Galvanized Pipe. Discounts in this section have been reduced to the following figures:

1½ and under, Plain.....	67½ %
1½ and under, Galvanized.....	69 %
1½ and over, Plain.....	75 %
1½ and over, Galvanized.....	65 %

Steel Goods.—In view of the low prices which have ruled during the past season on Steel Goods some of the large buyers are endeavoring to place orders for next season, but the manufacturers are generally refusing to accept them on former terms, anticipating that it will be feasible for them to obtain considerably better prices.

Bolts.—The market for Bolts, including Carriage, Machine, Stove, Tire, &c., is in excellent condition and characterized by a firm tone. The manufacturers of Stove and Tire Bolts are considering the question of prices and whether or not it is desirable to make an advance in these goods.

Wrought Iron Goods.—The Wrought Iron Goods market continues in about the same condition as prevailed last week, with a further improvement, as most of the lowest prices current have been withdrawn by the manufacturers, and there is a nearer approach to uniformity in current quotations.

Cordage.—The most important event since our last reference to the Cordage market is the appointment of receivers for the United States Cordage Company, an event which was not unexpected in view of the recognized difficulties under which the company was operated. Its effect was therefore to a large extent discounted, and it is anticipated that it will have no direct influence on the Cordage market. It is understood, however, that the company have a considerable quantity of Cordage on hand, and if this should be forced on the market it might have the effect of disturbing prices for the time being.

Palm Oil.—An improved demand from Tin Plate manufacturers for the higher grades of Palm Oil has developed in the past week or two. Prices are also stiffer.

Asbestos Torch.—The Asbestos Torch, an illustrated description of which was given in *The Metal Worker* last week, is manufactured by the Asbestos Torch Company, 153 Milk street, Boston, and is sold to the trade at \$4 per dozen.

Mangle.—The Petersen Mangle, manufactured by Petersen & Fischer, 166 Pierpont street, Brooklyn, N. Y., of which an illustrated description was given in our last issue, is sold to the trade at \$8.50 each.

Glass.—The demand for American Window Glass is reported as being fair, showing an increase over that of preceding weeks, but as not overtaxing either the manufacturer or jobber. The shipments of Glass for the past month or two, it is understood, have not exceeded the production for the same period. Prices as a rule continue firm, as manufacturers appear to realize the necessity of maintaining a profitable figure. The discounts which went into effect and apply to the new list of Window Glass adopted May 1, 1895, are as follows: Less than 100 boxes, 75 and 5 per cent. discount; car lots, 75 and 10 per cent., and 1000 boxes, 75 and 10 and 5 per cent. discount. Business in Plate Glass continues to improve, and although the 60 day shut down of the factories of the Pittsburgh Plate Glass Company is now at an end there are no indications of an immediate resumption.

Old Metals.—A marked improvement is noted in the market for Old Metals. In sympathy with the advance which has taken place recently in every line of metal, prices on Scrap are also higher. Some considerable shipments of Old Copper and Brass have been made lately to Italy and other foreign countries, and the demand from this quarter is still quite active. For Scrap Iron the demand is quite brisk and dealers are offering higher prices. The following quotations represent the rates now being paid for moderate sized lots by dealers, New York delivery:

Heavy Copper.....	lb 75¢
Light and Tinned Copper.....	lb 74¢
Heavy Brass.....	lb 5¢
Light Brass.....	lb 4¢
Lead.....	lb 3¢
Tea Lead.....	lb 28¢
Zinc.....	lb 25¢
No. 1 Pewter.....	lb 41¢
No. 2 Pewter.....	lb 41¢
Wrought Scrap Iron, gross ton.....	\$8.00 @ \$8.50
Heavy Cast Scrap..... gross ton.....	8.50 @ 9.00
Stove Plate Scrap, gross ton.....	8.00 @ 8.50
Burnt Iron..... gross ton.....	5.00

Old Rags, Paper, &c.—Paper Stock has been moving actively in the past week. Dealers' purchasing prices, New York delivery, rule as follows:

No. 1 White Rags.....	lb 3¢ @ 3½¢
No. 2 White Rags.....	lb 2¢ @ 2½¢
Mixed Rags.....	lb 1¢ @ 1½¢
Blues and Sds.....	lb 1¢ @ 1½¢
Hard Sized White Shavings.....	lb 2¢ @ 2½¢

Trade Notes.

ELSEWHERE in this issue will be found the announcement of the Nivn & Hassard Tin Plate Company of Philadelphia, Pa., who call attention to their assortment of Tin Plates and give their brands of roofing and brights.

THE MONTHLY CALENDAR BLOTTER distributed by the Joseph Dixon Crucible Company, Jersey City, N. J., breathes forth the lazy atmosphere of June by means of a combination of a stream, a fish line, a tree trunk and a boy.

A PLANT for manufacturing Pumps and Heaters is to be erected by Pharr & Moffatt at Charlotte, N. C.

THE PLANT of the Youngstown Stamping Company, Youngstown, Ohio, manufacturers of Oil Cans and Tinware Specialties, has been sold by W. C. Hine, receiver, to Ensign Brown, representing a committee of creditors, for \$13,525.27. The plant has been operated by W. C. Hine, receiver, for several years past, and a new company are now being organized by the creditors, who will take possession of the property some time during this month.

NEGOTIATIONS are understood to be on foot looking to the resumption of operations at the Soho Iron & Steel Works of Moorhead-McCleane Company, at Pittsburgh, Pa.

JAMES L. PRYOR, JR., has opened an office in the Beekman building, 101 Beekman street, New York. He is prepared to furnish Sheet Brass and Copper and Aluminum, and is the agent for the F. L. Gaylord Company, Ansonia, Conn.

GURDEN CORWITH, Room 211, Beekman building, Beekman and Pearl streets, New York, is prepared to supply new and old Metals to the trade. He has recently made a shipment of 300,000 pounds of Scrap Brass to Italy.

THE MISSOURI BRASS TUBE FOUNDRY COMPANY of St. Louis, Mo., were recently incorporated, with a capital stock of \$50,000, by C. A. Manuel, W. J. Kenefic and Frank Leboha.

THE ERIE FOUNDRY COMPANY of Rochester, N. Y., have been incorporated, with a capital of \$12,000, to manufacture Iron and Brass Castings. The directors of the new concern are Frank H. Clement, J. Elwood McKelvey and Robert J. McKelvey of Rochester.

THE AMERICAN GALVANIZING WORKS of the McDaniel & Harvey Company, Sixteenth street and Washington avenue, Philadelphia, were damaged by fire on June 5 to the extent of \$3000 or \$4000. The flames originated, it is thought, from a live electric wire coming in contact with oil in the paint shop. After much hard work on the part of the firemen the flames were confined to the paint shop and stable.

New York City will this year spend about \$780,000 for new asphalt paving, principally in the poorer quarters of the city.

Some Dissatisfied Ones.

In circulating among the different trades which form the constituency of *The Metal Worker* it is exceedingly gratifying to find that the ruling sentiment to-day is one of marked cheerfulness. A revival of confidence in the present and of hopefulness in regard to the future is apparent. This is very pleasant to contemplate, after the long spell of depression through which all the trades have just passed. Nevertheless this wholesome atmosphere is not by any means universal. There are quite a number of men one meets who seem to have become so permeated with pessimism, as the result of two years of disappointment and discouragement in their business, that even with the multiplying evidences of returning prosperity all around them they cannot shake off the complaining tone to which they have accustomed themselves. If you ask them how they find business they will reply with a lugubrious air that it is very dull. On further inquiry you will probably elicit the fact that they are doing more business than they did a few months ago or at the same time last year. But they hasten to explain that it is all done at such low prices that there is really no profit in it. Or they may say that business is a trifle better, but that it is on the whole disappointing and not at all up to the standard they had looked for. As to the future, they see nothing to encourage them in the hope that it will ever be better. At the same time, perhaps, the man next door and another across the way, who are engaged in precisely the same kind of business, will tell you that they find things very brisk. The fault, of course, lies with the man himself and not with business. He has made up his mind for a big boom, both in the volume of business and in prices, and the boom has not materialized. Instead thereof a steady and gradual increase in the amount of business has taken place, almost imperceptible, per-

haps, as yet in some directions. But this does not fulfill his expectations and desires. He is, accordingly, soured and determined to see no good in anything under the sun. He forgets that as Rome was not built in a day, so prosperity, to be enduring, cannot come by leaps and bounds. It is far more satisfactory that the improvement in general business is developing in a gradual and positive manner than by any inflated methods. The promise of permanence and stability which the present ratio of improvement gives is thoroughly appreciated by all far seeing and sensible business men.

Sanitary Exposition in Paris.

An International Sanitary Exposition was opened in Paris, on the Champs de Mars, on June 1, and will continue until September 15. The exhibition is under the patronage of the French Ministers of Commerce of the Interior and of Public Works, as well as of various learned societies and industrial associations. The exhibition is divided into ten classes, being, respectively, Hygiene of Dwelling Houses; Municipal Hygiene; Prevention of Infection; Demography and Sanitary Statistics; Sanitary Science; Hygiene of Infancy; Industrial and Professional Sanitation; Food Hygiene; Hygienic Clothing, and Physical Exercises. Class 1—Hygiene of Dwelling Houses—includes instruction in preparation of ground; underground arrangements; light; heat and ventilation; water supply; baths and lavatories; sewage treatment; sinks and water closets; sanitary ware for the household; and special sanitary arrangements for hospitals, barracks, prisons, theaters, public halls, &c. Class 2—Municipal Hygiene—includes water supply; purification; filtration; street cleaning; treatment of sewage and refuse; street lighting; gas; electricity, &c. In conformity with the municipal law recently passed in Paris, the whole of the house drainage in that city will have to be rearranged in the course of the next three years on a plan similar to that in use in England. This will necessitate a revolution in the sanitary arrangements of Paris and will involve a great demand for improved forms of sanitary apparatus. It is in order that these may be brought under the notice of the engineers and architects of Paris that this special sanitary exhibition has been opened.

An Eastern municipal engineering club has gathered statistics from the city engineers of 300 cities of more than 10,000 population, which show that more public work will be undertaken during the coming summer than ever

before. It is estimated that expenditures for paving, lighting, sewerage works and bridges will approximate \$200,000,000. Last year less than one-fourth of this amount was expended in city improvements.

Economy in Division of Labor.

We were recently surprised, while visiting a large and well known establishment engaged in the manufacture of machine tools, says *The Iron Age*, at the extremely low cost of producing some of the parts. Inquiry developed the fact that this was due, primarily, to the method pursued in apportioning the work and was not, even indirectly, the result of the use of any special appliances. It was a most refined appreciation of the prominence played by the cost of labor in producing the parts and the division of this labor so as to yield the greatest results for the least expenditure. It did not come as a sequence to small wages, as the average amount paid was unusually high.

All work not to gauge and which did not require undue accuracy was performed by the cheapest help. In cases in which close fits were necessary the parts were roughed out and brought nearly but not quite to a fit by cheap labor, the actual fitting being done by more experienced and higher priced men. In the storeroom all the pieces of certain parts of a machine were placed together; for instance, all the parts of a lathe carriage or apron were grouped together. But these parts were not finally fitted and the apron assembled until it was decided to build a number of lathes of that particular type. Then the parts were taken to the expert mechanic, who had so little work to do that his contribution in wages to the total cost was insignificant.

In the storeroom every piece carried a tag giving the exact cost of the work done on it up to that time. With this as a guide the cost of the completed machine was simply the sum of the cost of all the parts, in addition to the cost of the last fitting and assembling. With the exception of parts like handles, the cost of which was carried in groups or by the dozen, the cost of making each individual part was placed upon it. This was done as a check. If one part cost more than the average, an inquiry developed the cause and suggested the remedy. Not the least important advantage of the system is the facility it offers for charging for parts for repairs. There is absolutely no guesswork and the prices charged are fair to both the builder and user of the machine.

THE LETTER BOX.

Greenhouse Heating.

From J. Y. N., Jersey City, N. J.—In *The Metal Worker* of June 8 I notice the inquiry of "F. M. P." for information on greenhouse heating. Instead of calculating by the cubic feet thumb rule for calculating radiation for house heating and greenhouse work the estimate is made from the square feet of glass surface exposed. This varies with the temperature of the water and the climate. Ordinarily 1 square foot of heating surface is assumed to heat from 2 to 3 feet of glass surface. If the building is sheltered and the water circulates at a temperature averaging close to 180°, 1 square foot of surface in the pipe will take care of 3 feet of glass surface. If, on the other hand, the building is in an exposed position, where the wind will have full sweep at it and water circulates between 150° and 160°, 1 square foot of heating surface will be required to heat 2 feet of glass surface. At the present time there are two classes of greenhouse heating men, some favoring the old fashioned 4 inch cast iron pipe, and others preferring 2-inch wrought iron pipe. The cast iron pipe, roughly calculated, exposes 1 square foot of heating surface per lineal foot, while of the 2-inch wrought iron pipe it takes 1½ lineal feet to expose 1 square foot of heating surface. It is claimed that, owing to the larger bulk of water in the 4 inch pipe, better service is rendered in case of the fire going down; the larger body of water will take a longer time to cool off and will prevent the plants in the greenhouse being frozen, when a smaller 2-inch pipe will cool more quickly and with greater risk to the plants. When the 2-inch pipe is used wrought iron pipe is generally preferred, owing to the ease with which it may be fitted up with the ordinary pipe threading and fitting tools. When the cast iron pipe is used joints are made with iron filings for a cement, first calking into the hub of one pipe around the spigot end of another piece of pipe to prevent the iron filings getting inside of the pipe. The iron filings are then wetted down with water which is slightly salted. These pipes are usually run under the benches on which the plants are set; and, where three or four pipes are required to present sufficient surface they are placed on a level, not one above the other. At the high points in the heating coil an air valve must be located and the system fitted with an expansion tank, as the water will expand ⅓ of its bulk, or when heated 22 gallons of water will occupy the space of 23 gallons. The top of this expansion tank must be above the highest point in the heating system. It is best to draw a plan to a scale of the building to be heated, with the plant benches laid out upon it, and then lay out the piping on the plan. In this way all the probable difficulties that will arise in piping the job will be met in advance and arrangements can be made to overcome them. After the amount of radiation has been determined the size of the boiler required can be calculated by dividing the amount of radiation required by from 10 to 15, which is the amount of heating surface that 1 square foot of grate surface in an ordinary boiler will carry. When the amount of radi-

ation which is required in the greenhouse has been found the selection of the boiler is not very difficult, as in these days all manufacturers give a rating of the radiation which the different sizes of their boilers will properly take care of. It is always best, however, to use a larger boiler than will just do the work; and if the heating contractor will take sufficient time and interest to explain the value of ample heating capacity in a boiler to his customer he will probably have no difficulty in getting the increased price that the larger boiler will cost. If "F. M. P." will submit his greenhouse plan to a first-class heating engineer, and spend the time with him while the cal-

give rise to the chloride formation, and furthermore the chloride is soluble in water and would not, therefore, remain on the metal. Wherever there is visible evidence of the corrosion of zinc it is decidedly unwise to drink water contaminated by it.

How Can a Windmill be Attached?

From J. G. S., Norristown, Pa.—I submit the following sketch of the water works system in my house, and I would like to learn from the readers of *The Metal Worker* some way to

How Can a Windmill be Attached?

culations are being made, the information which he will gain will be of far greater value than the fee which he will have to pay.

Zinc Vessels for Drinking Water.

From F. F. F., Providence, R. I.—There is a difference here as to drinking water which has been confined in a galvanized iron tank for a period of from eight to ten hours. Some claim that at the top edge of the water line and on the edge of the tank there is a white powder, which is chloride of zinc and is poisonous.

Note.—We do not believe that zinc is a proper material to hold drinking water. It is quite easily corroded and the salts of zinc are harmful. In the case cited by our correspondent, however, we do not think he is right in referring to the salt as a chloride of zinc; it is more likely the oxide or the carbonate. There should be no chlorine in the neighborhood of the tank to

change the supply from a hand force pump to a windmill. I do not wish the windmill to be attached to the building, but wish it away from the house, yet I desire it to be attached to the same pump without taking it out or going to any great expense. It is quite probable that some of the readers have solved a similar problem in the past and I know that their method will be of interest to more than myself alone.

Note.—We hope our readers will respond to the request of this correspondent, who, however, will also find some information that may be useful to him in *The Metal Worker* of May 11.

Tinning Black Iron.

From J. W. H., Whitesville, Mass.—Will some of the readers of *The Metal Worker* please inform me through the Letter Box what is the best method of mixing a solution for tinning black iron?

Note.—We are quite at a loss to understand what our correspondent desires. There is a pickling solution to

which the black iron, if in the form of sheets, is subjected, but this is merely acid and water and really has nothing to do with the tinning. The tinning solution, if we can so term it, is a bath of melted tin. Perhaps we have entirely misunderstood our correspondent, and if so we shall be glad to have him explain his wishes further.

Setting Floor Tile.

From M. S. E., Westminster, Md.—I would like to get some information about laying a tile floor in a bathroom and also about setting the tiles for wainscoting. I do not know what kind of cement to use for laying the tile on the floor, or how the tiles in the wainscoting are kept in place until the cement sets.

Note.—We shall be glad to have our readers give their methods of doing this work. In order that our correspondent shall have some information to aid him in his work he can adapt the following suggestions to his use. A common practice is to nail strips lengthwise to the joists far enough below their top surface to permit a board flooring to lay upon them, with a brick pavement on top of this again, so that the surface of the brick just comes flush with the top of the joist. After the floor is thus prepared it is grouted with a cement made of one part good sharp clean sand and from three to five parts of Portland cement. After this has been carefully done and the surface leveled up while the cement is yet soft the tiles are bedded into the cement. It will be readily seen that the greater the care used the smoother and more level the floor will be. For wainscoting, the face between the studs is filled in with a board back up to the height the wainscoting is desired, and sufficient space is left for brick on edge to be set in good mortar against this back. The surface should be plastered over the same as if it were to be a finished wall and then the face scratched in order to make a key for the cement. In setting the tile of the wainscoting more skill is required, and in order to have the cement set quickly and smoothly a quantity of plaster of paris is mixed with it. The success of getting a smooth, true surface for the wainscoting depends largely upon smoothing up the surface of the brick work before using the cement.

Tarred Paper Under Roofing Tin.

From A. S., Paris, Ill.—Will the readers of *The Metal Worker* inform me if tarred paper placed under a tin roof will injure the tin? What kind of paper is the best to place under a tin roof?

Sheet Metal for Ventilator.

From J. W., Perryville, Mo.—I wish some readers of *The Metal Worker* would inform me through the Letter Box which would be the better material to use for a common 6-inch ventilator, tin or black iron.

Note.—As our correspondent has so specifically requested the opinions of our readers we will leave it to them

to answer him, although we cannot understand why he should be in any doubt about the merits of tin and black iron for a ventilator which is, presumably, exposed to the weather and would need some protection against rust.

Weight of a Metal Brick.

From INQUIRER, New York.—Is gold the heaviest metal? A friend of mine makes the assertion that a man cannot carry a block of gold the size of a brick. This seems very absurd to me and I think he is a little off in his calculations. What will a block of gold the size of a brick weigh?

Answer.—Our correspondent's friend is not so far off as he thinks, and while an ordinary man would be able to carry a gold brick we think it would be a difficult matter to pick it up from the top without a handle. A block measuring $8\frac{1}{2} \times 4 \times 2$ inches, if made of pure gold, would weigh $46\frac{1}{2}$ pounds. There are, however, three known metals heavier than gold, the best known of them being platinum, which if made in the form of a brick would weigh 51 $\frac{1}{2}$ pounds. Iridium and osmium are metals which are also heavier than gold. The latter is the heaviest known metal, and an amount the size of a brick would weigh almost 54 pounds.

Soldering Aluminum.

From D. L. W., Moodus, Conn.—I would like to know through the Letter Box if aluminum can be soldered with tinners' solder, or half and half solder?

Answer.—One of the difficulties in working aluminum is to solder the metal, and special solders have to be used for the purpose, the ordinary tinner's solder not being suitable.

Iron and Brass Pipe Plumbing.

From T. E., Hamilton, N. Y.—I would like to find out through *The Metal Worker* what is the general custom for connecting basin and bath cocks and closet tanks where iron or brass pipe is used. All the fittings seem to be for lead pipe.

Note.—We trust some of our plumbing readers will furnish the information desired.

The Origin of the Wiped Joint.

From A SANITARY PLUMBER, New York.—On Saturday of every week, when *The Metal Worker* is delivered to me, I go through it carefully and make a note of anything that may prove useful in the future. One subject I have never seen discussed, and that is how the wiped joint originated and who invented it. Is this known?

Note.—We leave this subject for the discussion of our readers. None of the plumbing works at hand give any information on the origin of this art. It has been suggested by one of the most prominent plumbers in this country at the present time that Columbus discovered it when he discovered America.

The Electrical World of New York, in a recent issue, states that from tests and experiments made with an inclosed

electric arc lamp it has been discovered that carbon monoxide in small quantities is produced in the arc. It points out that in small rooms this poisonous gas is formed in sufficient quantities to cause serious results. Consequently adequate ventilation is necessary in all cases where many arc lamps are kept burning.

Electrically Caused Fires.

William McDevitt, chief of the electrical department of the Philadelphia Fire Underwriters' Association, recently gave a demonstration of some of the ways in which fires may be caused by electricity. The first danger was that arising from the common practice of grounding telephone wires on gas pipe. A bad connection is generally made—quite sufficient for telephone purposes—and then if the telephone wire becomes crossed with an electric light wire the larger current, meeting resistance at the ground connection, heats the joint, punches a hole in the gas pipe and the arc formed lights the gas. Mr. McDevitt gave a complete demonstration of the gas and insulation on the wire burning simultaneously. He also exhibited a section of gas pipe that had caused a fire in just this way. The wires in the sockets of electric lamps are liable to touch the casing, when an arc may be formed. For this reason no drapery should be used around the lamp sockets. The advantage of using metal conduits with insulated lining through which to run the wire was demonstrated, a wire outside being dangerously heated while from that inside the conduit there was no risk. A caution was given against the rough handling of flexible cords used for electric lights as a common cause of short circuits and fire. There are other dangers, due to ignorance on the part of the general public of the character of the electric current. In one case on record the walls of a room were upholstered with stuff in which were woven a great number of metal threads. These were in contact with the electric wires, and when the current was turned on the whole room was set ablaze. An obscure danger from frictional electricity has been traced. Sparks may be caused by shuffling the feet on carpet or by the rubbing of silk. Where benzine is used to clean such materials a spark thus caused may give rise to a dangerous fire. It is believed that some benzine fires have been caused in this way. Another cause of fires is the unreliability of fuses. They are put in the line to be burned out when an excessive current is turned on, but, like safety valves, they do not always work. If they fail to fuse a dangerous current may be carried along the line. To obviate this danger a standard should be adopted.

Some French military authorities are proposing that aluminum cuirasses shall be provided for the cavalymen of the French army, on account of the lightness of the metal and of the fact that experiments have proved that aluminum can resist sword thrusts or bayonet lunges. Bullets striking it directly will pierce it, but at close range the present steel cuirasses are equally puerous to rifle bullets. Should, however, a ball strike an aluminum cuirass obliquely the softness of the metal would cause it to glance off, leaving only a dent. This, it is claimed, gives it an additional advantage as a shielding material over other metals.

PLUMBING and GAS FITTING.

Thirteenth Annual Convention of the National Association of Master Plumbers.

The thirteenth annual convention of the National Association of Master Plumbers was held in Philadelphia this week. The strength of the organization was demonstrated in the very large attendance of delegates. Delegations from all over the country began to arrive on the previous Saturday and by Monday the assembly was almost complete.

The headquarters of the association was at the Continental Hotel, the large parlor on the second floor being utilized as a general reception room. The business meetings of the convention were held in the Walnut Street Theater, adjacent to the hotel. The stage was handsomely decorated for the occasion with palms and other plants. An arch representing solid gray granite on polished red granite columns was thrown across the stage, bearing on the top a vase of golden rod and having suspended from the keystone a floral model of the "Liberty" bell. The span of the arch represented 13 stones, emblematic of the conventions held by the organization, each stone bearing a convention date and the name of the city in which it was held. The center, or keystone, of course bore the date of the present convention.

The officers were provided with special furniture, the president having a high paneled table bearing a representation of the seal of the association on its front. The secretary and treasurer occupied paneled tables on either side of the president. A handsome silk national flag and a few well chosen theatrical properties were tastefully grouped in the background and added not a little to the effective setting. The fronts of the balconies and the boxes were draped in the Philadelphia colors, blue and gold, with festoons of evergreens for contrast. A few banners of State associations ornamented the tops of the lower tiers of boxes.

The Executive Committee of the association held a meeting on Wednesday afternoon at headquarters for the purpose of completing arrangements and discussing other matters within their province. The following members comprised the committee:

President, John Mitchell of New York.

Vice-President, L. B. Cross of Kansas City.

Recording Secretary, H. J. Pattison of New York.

Treasurer, W. E. Goodman of Milwaukee.

D. G. Finnerty of Boston, James Meathe of Detroit, Henry G. Gabay of New York, John Trainor of Balti-

more, C. C. Dewstoe of Cleveland and Paul Redieske of Chicago.

TUESDAY MORNING.

At 10 o'clock the delegates assembled in the Walnut Street Theater, completely filling the auditorium. The balconies accommodated a number of the lady visitors who were in attendance to hear the opening addresses.

John E. Eyanson, President of the Philadelphia Master Plumbers' Association, welcomed the delegates on behalf of his association.

Select Councilman Wm. McCach, chairman of the Committee on Arrangements, next introduced the Mayor of Philadelphia, Hon. Chas. F. Warwick, who, in a happy speech, warmly welcomed the visitors to the "City of Brotherly Love." The Mayor's address was responded to with hearty cheers. President Mitchell, in a short speech, then cordially greeted the delegates and expressed the thanks of the meeting for the kindly welcome extended by the City of Philadelphia through Mayor Warwick.

The President then appointed Samuel B. Fleming, Geo. W. Beckett and John Furlow, all of Philadelphia, sergeants-at-arms.

Upon motion a committee on credentials was then appointed, consisting of

Jas. F. Davlin of Somerville, Mass.

Jeremiah Sheehan of St. Louis.

Thos. P. Culloton of Chicago.

H. C. Bowman, Baltimore.

John L. E. Firmin of San Francisco.

The convention adjourned until 2 p.m. to await the committee's report.

TUESDAY AFTERNOON.

Jas. F. Davlin, chairman of the Committee on Credentials, made a report from that committee showing that 15 State and 76 local associations were represented by 397 delegates, a slight increase in the number present at the last convention. Following is a complete list of delegates in attendance, as reported by the committee:

List of Delegates.

ALBANY, N. Y.

Horace F. Wescott, Jos. A. Stahl, John E. Dugan, Edward James, Fred W. Ridgway.

ALLENTOWN, PA.

Jno. H. Birchall, Ang. Liebold, F. E. Whitesell, Bethlehem.

ALTON, ILL.

P. J. Kane.

ALTOONA, PA.

G. M. Stewart, A. E. Akers.

ARKANSAS ASSOCIATION (STATE).

M. F. Smith, Fort Smith; A. A. Mandelbaum, Little Rock; Henry W. Bonner, Hot Springs.

ASHEVILLE, N. C.

W. H. Boyce.

AURORA, ILL.

Russ Lake.

BALTIMORE, MD.

H. C. Bowman, John Trainor, J. F. P. Carey, G. R. Minnick, Daniel J. Barry, J. C. Mitchell, George Knipp, P. A. Sullivan, James Trainor.

BLOOMINGTON, ILL.

R. Loudon.

BRIDGEPORT, CONN.

T. E. Logan, H. B. Middlebrook, G. E. Scofield.

BROOKLYN, N. Y.

Edward MacDonald, H. L. Potter, H. M. Noble, Thomas H. Radcliffe, Edwin Hayward, Geo. B. Lewis, O. O. Sawkins, J. J. Keenan, J. W. Kelley, M. F. Gleason, M. Fallon, L. Haff, Wm. J. Gault, B. J. McBride, Geo. W. Smythe, D. F. Mentzinger, Thos. Kelly, E. McNamara, W. E. Williams, R. J. Knox.

BOSTON, MASS.

Wm. H. Mitchell, David Smith, James F. Davlin, D. A. Horgan, Thos. J. Tute, John K. Tully, J. Warren French, Edward C. Kelly, Wm. A. Tucker, John W. Cosden, James O'Connell, Thomas E. Sharpe, J. C. Kelly, Daniel Shannon, James Tucker, Chas. M. Brownich, D. G. Finnerty.

BUFFALO, N. Y.

James S. Stygal, Jr., Wm. H. Martin, Charles Geiger, C. Brenner, F. H. Yuhl, H. J. Knepper, J. H. Castler.

In connection with the report of the Committee on Credentials Chairman Davlin read a letter received from the president and secretary of the Master Plumbers' Association of Montreal, embodying a copy of a resolution passed by that organization on the 6th inst. appointing John Date, the association's first vice-president, a delegate to represent it at the convention of the National Association of Master Plumbers, at Philadelphia, and requesting that he be allowed such privileges as could be permitted.

Upon motion the representation was accorded and Mr. Date was introduced to the meeting amid applause. Mr. Date suitably acknowledged the courtesy and expressed a hope that the growing interest as regards organization among Canadian plumbers would lead to an affiliation of their associations with the National Association of the United States. As a plumber of 50 years' experience he appreciated the mutual benefit to be derived from such a course.

After roll call W. H. Doyle moved that a Committee on Resolutions, consisting of five delegates, be appointed. The motion being carried the president appointed:

Wm. H. Doyle.
E. J. Hannan.
P. J. Kelliher.
S. E. Dibble.
T. C. Boyne.

The committee appointed at the last convention to report on the proposed revision of the constitution made a report through its chairman, Edwin Hayward of Brooklyn. The report appeared to go somewhat further into the subject than was contemplated at the Detroit Convention, and recommended amendments throughout the constitution which the president decided could not be considered by the association at this convention. After an extended discussion, during which the features of the situation were viewed from all points and many motions for disposal of the question were made, the report was finally, on motion of D. M. Quay, referred back to the committee, with instructions that they make a report on the lines laid down at the Detroit Convention.

John L. E. Firmin of San Francisco, chairman of the Sanitary Committee, presented the following report of his committee:

Report of Sanitary Committee.

Your committee herewith most respectfully beg to submit their report. Glancing over past labors of this committee it might seem a fruitless and idle talk to further cultivate the field of sanitation; it would appear that so tillied and subsoiled has the land become and so many crops have been gathered as to make it promise but

poor reward for further labor. Such a conclusion, however, we think erroneous. The truth ever remains the truth—principles never change. Nature will revert to first principles; so long as we remain in the van of civilization so long shall we discover the truth and proper methods of the application of principles, and so long shall it remain our duty to teach the principles of these truths to our less enlightened fellow men. In one respect we are of the opinion that this committee is inappropriately named, for it is not alone a sanitary—i. e., "a preservation of health"—but more a sanitary—i. e., "a conducive to health"—committee to the full extent and meaning of those terms.

In reviewing labor performed our object is to offer records—vouchers, as it were—as proof of our worthiness and sincerity. Our constitution affirms that "this association is organized for sanitary purposes." That this is not an empty assertion, we would refer to the fact that prior to our organization there was no through-out the whole United States not one town or city which had any form of law governing the business of plumbing. There was not a single instance of that class of legislation, except such as appertained to blind cesspools and ordinances bearing upon the tapping of water mains, &c. These comprised all that we now term "Sanitary Plumbing Laws."

Statistics informed us that we suffered from a fearful percentage of preventable diseases and that the span of life was of an abnormally contracted radius; that the sacrifice of children was such that the mere relation of facts made the Christian heart bleed; worse still, we looked upon these conditions as normal, as natural adjuncts of civilization. He who doubted you was referred to the plagues of the past and was told that they were the inevitable accompaniments of civilization. As London in the past had her plagues, so must London have them now and in the future. That as cholera seemed to belong to the pilgrims of Mecca, as part of their devotions to Mohammed, therefore all the currents of commerce must be contaminated and society suffer. All of these inflections science has proved to be not necessary adjuncts to civilization, and that these calamities which we had brought upon ourselves and believed to be the acts of Providence really were born of a defiance of one of the first tenets of godliness—cleanliness. Rome with all her beauties, charms, cultivation, sanitarians still called the "sink of nations." This title she earned from her utter disregard and defiance of sanitary and sanitary principles. We have recited the utter lack of sanitary laws as we found at the time of our organization. Now note the change. The necessary preliminaries performed, immediately throughout the entire country the Master Plumbers' Association, by various honorable, just and enlightened efforts—efforts exerted, too, under the most trying conditions of ridicule, sarcasm, ignorance and narrowmindedness—obtained what are now generally termed "plumbing laws," or "Rules and Regulations of Plumbing and Drainage." To such an extent did our labors ramify that at this writing there is no city or town, and hardly a hamlet, which is not in a greater or lesser degree controlled and benefited by our labors. In bringing to your attention what has been accomplished our aim is not self laudation or a desire to speak of the work as accomplished and complete. Isaac Newton, when complimented upon his great knowledge, replied "he had but lived long enough to discover he knew nothing." We have progressed far enough

to discover that our field of labor opens out before us as a plain reaching far beyond our horizon. At this point we believe it our duty to lend all our weight as a great association to the ends of introducing and perfecting our plumbing laws. We would advise that each association give their most earnest attention to the selection of the timber forming their various sanitary committees. We also point out the importance of our Committee on Legislation. Long since we discovered that without the necessary legislative feature, practical application has been impossible or nearly so. Upon every favorable opportunity endeavor to disabuse the public of the idea that our legislative labors are selfish.

In the nature of things it is impossible to form laws which would be equally appropriate to all sections of our country. That which would be best suited to the needs of Michigan would prove most faulty for Louisiana. A system approaching perfection as applied to California would be ridiculous as applied to Maine. And right here is just where our association is doing a work grand in its results, which should call forth the admiration of all advanced minds, and that is that our local associations are in their nature, by education and training, boards of expert sanitarians, who are ever searching for, discovering and applying improved methods of sanitation which are most suitable and practicable, each to his individual requirements of locality. A feature which we think should receive our special attention is the endeavoring, by all honorable means, to have representative master plumbers act as members of boards of health. This advance step has been partially inaugurated. In view of a singular apathy and professional ethical opposition we may expect rebuff and unfriendliness. But we in the past have met and conquered that, and knowing we are right and while ready freely to grant to the professional man his proper territory we at the same time must demand the recognition of the fact that in the field of practical sanitation we alone are competent, by the fact of technical education and training.

We also bring to your immediate attention a danger which while not new, yet has been born during the past few years. This danger is at once serious to the public and ourselves as business men, in so much as that out of a feeling of security insecurity has been given birth. Out of a too implicit reliance in the plumbing laws upon the part of the public has arisen and grown a series of dangers from both mechanical and scientific ignorance and the dishonest execution of supposed legal requirements. There has arisen a belief that now it is not necessary to use care in the choice of your plumber, since he is by law compelled to comply with modern sanitary principles and mechanical arrangements. Never was a greater error committed by the public. These facts we are satisfied you long since discovered and as readily saw their far-reaching results for evil. We touch upon this feature solely with a view to strengthen and renew your efforts looking to an enlightened understanding upon the part of your patrons.

We, as a committee, consider it our duty to take up practical ends as well as theoretical, and in this connection would advise steps be taken looking toward a more thorough and general system of State organization. In this connection we would recommend that in the initial labors the national body assume at least a portion of the expense of organization as a sanitary committee. We take this view from the fact that without State organization it is in many States practically

impossible to have State sanitary legislation. It would be but just to our allies, show a wise conception of our own interests, as well as performing a duty to civilization, to here emphasize the immeasurable importance of the sanitary press. It would seem at this stage of man's progress to require no words upon our part to demonstrate the weight of the press. Our calling has been to a great degree fortunate in being represented by a technical press which for intellectual acumen and moral responsibility and sincerity, coupled with "go ahead" vim and perseverance, has few peers. In the press we have a medium ever ready to hear us, speak for us, fight for us; and, what is more, it sows the seeds of wisdom throughout all the highways and byways of the land. These things it does in a manner at once educatingly and entertainingly and to a degree that without such means we might never have hoped for; and so we would say—encourage, advise, give information and support to the sanitary press of the country.

One of nature's laws is that of decay. Upon the completion of a piece of plumbing and the granting of a certificate the majority of our patrons imagine all responsibility upon their part ceases. Now, while modern plumbing is so arranged that when well done the running expenses are but very light indeed, still, no matter how thorough and complete the time of completion, nature, assisted by use, abuse and neglect, will render that which was practically perfect most imperfect; therefore we would remind you of the very great importance of legislative action looking to and providing for periodical expert examination of sanitary appliances, more particularly of those premises controlled by municipalities, corporations, school boards, asylums, prisons, tenements, ships, &c., as we know by experience that this class of habitation is most liable to run into default.

We have thought it proper to call your attention to another source of danger—that is, alteration work and certain classes of jobbing. We all of us have experienced that "sickening sensation" where after using every care and applying our best efforts in bringing to completion a piece of plumbing, making it as nearly perfect as we are capable of, we shortly after found it ruined by some botch fitting up a closet, basin, sink, cesspool or rain conductor in utter violation of all sanitary principles; in fact, thus practically rendering all work which had been properly done nugatory. This evil we think could and should be regulated by proper legislation.

We should never lose sight of the fact that, as a whole, the strongest part of a system of plumbing is that which is most defective. Be it large or small building the principle remains good. Without the slightest desire to encroach upon the field of others, we think it our duty to point to the need of regulation by law of the distribution of light, sun and air and the limitation of height of buildings, no matter what fancied necessities selfishness may create. The laws are still very defective and too often more, imperfectly enforced in regard to providing proper conditions for sleeping rooms and the general planning of cellars, basements, sub-cellars, areas, &c. We, as a whole, are very far from having arrived at even a modest degree of perfection in this respect. There are numbers of buildings which stand in need of condemnation as unfit for human habitation. We would be lacking in our duty did we fail to enter our protest against what appears an alarming increase of shoddy plumbing goods. The market is flooded with inferior material. No sooner is a good article produced than immediately a

counterfeit appears, inferior but cheaper, until we have arrived where we might liken it to where

The little fleas that tease and bite us
Have lesser fleas to bite 'em,
And these lesser fleas have lesser fleas,
And so ad infinitum.

Seriously, we should cry, "Halt!" To continue as we are we ultimately will gain nothing; on the other hand, have everything to lose. We must keep faith with the producer of the good article, eschewing the inferior even if offering an immediate greater profit; otherwise the whole fabric of modern house plumbing must crumble by the mere fact of shoddy manufactured materials. We are compelled to give a certain guarantee; we must exact similar guarantees. In the United States there seems to be an ill devised system of statistics—ill devised as it is, more illy applied is it; to such a degree is this the fact that even in the case of some of our metropolises that data upon which we should base our calculations are found so very defective that, in fact, they are worse than no data at all, since they would lead us to utterly erroneous conclusions. When we consider that scientific statistics are the fundamental basis of all sanitary deductions it will readily appear how very important is this feature of sanitary legislation. In a paper of this nature it is impossible to more than hint at the needs of the hour, presenting a general outline of future operation. This is all we have attempted; the more laborious duties of solidifying this perspective we leave, gentlemen, with you. Thanking you for your kind consideration, we are,
Yours,

JOHN L. E. FIRMIN, Chairman,
JOHN B. BUTTERWORTH,
JAMES MCGIVNEY,
JOHN CRIMMINS,
L. SCHOLES.

On motion of E. J. Hannan the paper was ordered to be printed and copies distributed among the members of the association and a copy sent to every municipality in the country.

J. J. Wade of Chicago then moved that the president be authorized to telegraph to the Central Supply Association, then meeting in Detroit, the congratulations of this association upon its organization, with best wishes for its success. The motion was carried.

The following amendments to articles 2 and 3 of the by-laws of the association were recommended by the Executive Committee and, upon motions, adopted:

ARTICLE 2. That the bond of the financial and recording secretary be increased to a sum not less than \$2000, as in the discretion of the Executive Committee may seem best, and that the surety be in a responsible guarantee company, and the fee for same be paid out of the national treasury.

ARTICLE 3. That the bond of the treasurer be increased to a sum not less than \$5000, as in the discretion of the Executive Committee may seem best, and that the surety be in a responsible guarantee company, and the fee for same be paid out of the national treasury.

An amendment to article 4 of the constitution, recommended by the New York State Association of Master Plumbers through its president, Wm. J. McDermott, was, after discussion and upon motion, referred to the Committee on Revision of the Constitution and By-Laws.

Other amendments to the constitution providing for the appointment of a national organizer and for the admission of plumbers doing business in the British Provinces were referred to the incoming Executive Committee.

Some resolutions recommended to the association for adoption by the recent Illinois State Association meeting at Rock Island having been referred to the Committee on Resolutions, the convention adjourned to meet again at 8 o'clock.

TUESDAY EVENING.

The convention was called to order at 8.30 o'clock and reports from the State vice-presidents were at once called for.

Iowa was the first to respond. For this State Henry Ewinger reported a satisfactory condition of affairs, many additions having been made to the list of organizations and amicable relations existing in all branches of the trade.

Simon Shulhafer, for the State of Kentucky, reported pleasant relations between the plumbers, journeymen and jobbers of the State.

Robert Loudon, for the State of Illinois, reported that in point of membership his State was the banner State of the National Association. Complete harmony existed in the organization and a good deal had been done toward securing good legislation in regard to sanitary matters.

Connecticut, through J. B. Weiant, reported amicable relations in its organization, with a satisfactory addition to its membership.

J. M. Life, for the State of Missouri, reported that the State carried 275 plumbers, of which number 228 were members of the association. Other details in the report, entailing discussion, the report was referred to the St. Louis delegation for further attention.

Massachusetts, through John F. Deedy, presented a lengthy report descriptive of the efforts made by its association to increase its strength and the difficulties it had surmounted. The organization was in good shape and doing good work.

Jas. H. O'Neill, for Nebraska, reported that the partial failure of the crops in 1892 and 1893, and the total failure of 1894, had naturally retarded the progress of the State organization. In the face of all discouragements, however, the association had extended its membership and had been able to devote much attention to legislation of matters of interest to the trade.

New Jersey made an excellent showing in the report handed in by John Hickman, and the effect of the work done by the association of this State was evidenced in the larger delegation sent to the convention this year.

Wisconsin was shown to be in a very flourishing condition by the report of W. H. Halsey.

J. B. Smith, reporting for Maine, instanced some successful work done during the year and showed good pros-

pects for a strong organization in the future.

Oregon, through L. H. Buddemer, reported improvement in the prospects for complete organization sufficient to render representation at the next convention probable.

A year's good work and complete harmony among the trade was the substance of Wm. T. McGarrin's report for the State of Michigan.

The report of the District of Columbia, presented by Daniel Hannan, referred to some effective work done in this section and an increase in the association's membership.

Delaware, through I. N. Eaton, reported satisfactory progress and pleasant relations in the trade.

Jas. F. P. Carey reported an increased membership and a satisfactory condition for the State of Maryland.

John L. E. Firmin, for Northern California, made by permission a verbal report for the vice-president of that State, from which it appeared that the State association was in progressive shape, and had then on file 42 new applications for membership.

The Committee on Essays, through its chairman, J. Sheehan, reported that the work assigned to it had been completed and the essays selected were ready for a reading. On motion the reading was dispensed with and the essays ordered to be printed in the proceedings of the convention.

Some proposed resolutions having been read and referred to the Committee on Resolutions the convention adjourned, to meet again on Wednesday morning at 9 o'clock.

WEDNESDAY MORNING.

It was nearly 10 o'clock when the president rapped for order. The first business was the reading of some resolutions recommended for adoption by the convention. These were referred to the Committee on Resolutions.

The Committee on Credentials reported the arrival since last report of the following delegates:

Iowa—G. T. Ahirns, Jas. Linane, Des Moines.

Pennsylvania, Northwestern Association—L. L. Lord.

Scranton, Pa.—J. J. Schneider, J. J. Gorman.

San Francisco—Jas. E. Britt, Henry Hufschmidt, Chas. Meehan, Garret E. Sweeney, Wm. D. Hotes, Henry Ickleheimer, C. J. Reiley.

Elmira, N. Y.—J. T. Sadler.

The report, on motion, was received and the delegates admitted to the convention.

The president's report was next read, as follows:

Report of President Mitchell.

In accordance with the custom of your president rendering an annual statement of the condition of the organization at the close of the association year for which he was elected, I have the pleasant honor of briefly reviewing the work of the year, not only that which I was delegated to perform, but a résumé of the work undertaken and accomplished by the various na-

tional officers. The report of the Executive Committee and the reports of the various State vice-presidents will review the situation more fully. I will also refrain from calling your attention to many matters which I deem inappropriate to lay before you in this report, but have thought it more fitting to leave for a future report, which will be presented to you at the proper time.

I have had many invitations to visit sections of the country, sometimes to give encouragement to old associations and at other times to infuse members of a new association with the right spirit toward one another, which is so necessary to the success of local associations. A few of the invitations I have accepted, but more have been declined, chiefly because I felt there were other national officers, located nearer the field of action, who could, in a pleasing and convincing way, impart to their fellow craftsmen the principles of associated endeavor. Where complaints have arisen requiring personal attention I have requested a member of the Executive Committee located nearest the scene of dispute to adjust the trouble, and in all cases honorable and satisfactory settlements have been reached. I have also been able to delegate some of the outside work to the executive clerk.

WORK FOR THE OFFICERS.

The year has been fraught with important events bearing upon our trade. Probably never before since our early history has there been so much need of united and wise action. By this I do not mean to be understood as entertaining fear for the future of our grand organization. It is past the experimental stage. Its past achievements and present strength are almost a guarantee for future continuance and success. But we need to be careful in our advance so that we will not have to undo some of our work. Especially do we need to be careful in our convention enthusiasm in passing resolutions which impose upon our officers considerable work, sometimes fraught with much difficulty. It is an easy matter to lay out a line of action, but quite another matter for your Executive Committee and president to carry it out. Some members seem to think there is nothing for them to do after the adjournment of the convention. The national officers are chosen to voice your sentiments and enforce your resolves, but without they have your united support they can do but little. My experience has been that some secretaries are too lax in attending to matters referred to them. Important matters have been delayed because the secretary has been communicated with when it was the rule in that association that the president should receive all letters, while it has been the reverse in other associations. Local associations seldom take the trouble to notify the national office of an election of new officers, and the only means of knowing is to watch the trade press. From lack of knowledge as to who the officers were your executive has communicated with the old officers several times and given offense to the new officers, and the latter have not been slow to remind him of the grievous mistake. I hope my successor will not be hindered in this manner.

SUPPLY TRADE ORGANIZATION.

Since we last met the supply trade has organized, and the Eastern Supply Association has informed us in unmistakable language of its motives, which are embodied in the following resolutions:

Resolved, That the members of this association will not hereafter consider individually any communications or complaints from local plumbers' organizations, relative

to trade arrangements or conditions, unless the same shall have first been submitted to the State Executive Committee of such master plumbers' organization, where such exist, and by them conveyed to the secretary of this body is hereby ordered to communicate with the Executive Committee of the trade associations with a view of devising means to facilitate the amicable and satisfactory adjustment of all complaints coming from members of either body.

In case a State or local association of master plumbers makes a demand upon any member of this association to confine its sales of plumbing goods in that State or locality to members of said master plumbers' association, such demand shall at once be referred by such member to the secretary of this association shall thereupon communicate in writing with the secretary of the master plumbers' association of said State or locality, informing him of the fact that the policy of this association is to adhere strictly to the Baltimore resolutions, and that the said Baltimore resolutions specifically state that licensed plumbers, regularly engaged in the plumbing business, and with an established place of business, are entitled to purchase plumbing goods, this association does not deem it wise or expedient to depart from this rule. In the event of failure to receive redress from the local association it shall be the duty of this association to again take up the matter and refer it to the secretary of the National Association and notify him that until such time as the boycott has been raised the operation of the Baltimore resolutions will cease.

The first resolution was offered and referred to the Executive Committee of the Eastern Supply Association at its first meeting, held in New York City, November 19, 1894. Soon after its passage I remarked through the trade press that I considered the resolution an unjustifiable interference with the rights of local associations and a detriment to the amicable and speedy adjustment of complaints.

The last resolution was unanimously adopted at the second meeting of the Eastern Supply Association, held in New York City on March 12, 1895. Through the trade press I made the following comment on the resolution:

The action of the Eastern Supply Association in the passage of this resolution meets my expectation of their organization, its objects and head officers. The plumbers of the country can expect little else. It is a direct blow to many of our local associations. Home rule, or local rights, are inalienable and the price of all local associations. The present peaceful relations are by this action endangered, but I am glad to say and feel that the master plumbers throughout the States, as now organized, are equal to the emergency. Our aims are just and tend toward harmony, and the plumbers and members of the National Association will defend the rights of locals in their efforts for a livelihood and in their desire to trade with manufacturers who pursue reasonable business methods in an honorable way, without regard to threats.

Some feel that the supply associations can be made beneficial to our members, while others hold different views. It now behooves us as worthy, independent master plumbers to think carefully before we act. Let us be unanimous in all our acts and then without a dissenting voice or act stand by whatever enactments are passed and the incoming officers, for they can do very little without the earnest support of the entire membership.

PRESENT STATUS OF PROTECTION.

We have been told that we have attained the standard of protection and beyond which it is unwise to go and that we should now turn our efforts in another channel. But I do not feel that our members think that complete protection has been accomplished. The majority of local associations throughout the country have been greatly benefited by local agreements with local supply houses. I do not believe that any one claims that such ar-

rangements have not been mutually beneficial. I believe local associations have the right to enter into local agreements with their supply houses when such agreements are in consonance with the spirit of the Baltimore resolutions; provided, however, that they have been approved by the National Executive Committee or convention. In this case I think they should receive the moral support of the National Association. The trouble is that with the exception of a few cases local agreements have not been submitted to the Executive Committee. The Baltimore resolutions have been and are to-day the solid foundation upon which we must build, but they have been lost sight of in many sections.

THE BALTIMORE RESOLUTIONS.

One year ago, when I assumed the office of president, there were not over 25 copies of the Baltimore resolutions bearing signatures on file. I was surprised to learn of this state of affairs. Early in my administration I had occasion to communicate with a firm relative to selling to a consumer. The name of the firm being on the little book, having been forwarded by the local secretary, I had reason to suppose the firm had signed the Baltimore resolutions, but later developments proved the firm had exceptions granted by the local association. This experience convinced me of the necessity of having on file the signatures of all firms in sympathy with the resolutions. I first asked the secretaries of local associations to forward the signed copies in their possession, stating that inasmuch as they were national in character they should be in possession of the National Association. Chicago responded with 29 signed copies. Milwaukee 8. Boston forwarded copy of resolutions, without the last two amendments, with 17 signatures. Detroit forwarded resolutions, amended by Michigan agreement, with 8 signatures. Philadelphia 10, with exceptions. San Francisco 13 signatures, with exceptions. Kansas City 3 signatures, last two amendments not included. Rochester 5 signatures, last two amendments not included. The absence of the last two amendments on many signed copies proves how lax some associations are in observing new amendments, also how much work and annoyance to signers annual amendments signify. Many of the associations reported that if the resolutions had ever been signed they were lost. After collecting what I could from local associations I wrote to every firm in the plumbing supply business whose signature I did not have, with the gratifying result that there are to-day in possession of the National Association 271 signatures to the Baltimore resolutions. I have no doubt they will be carefully preserved for future reference, as they will be of great value to future administrations. Some of the small firms have not replied to the invitation to approve the resolutions, while a few have refused. In one city where refusal was met with the local association was asked to assist, but said local association answered that the local agreement was of more benefit than the Baltimore resolutions.

I intended to publish a list of those who had signed the Baltimore resolutions, but complications arose and I deemed it best to delay the printing of the list until after this convention.

ORGANIZATION WORK.

During the year considerable money has been spent in organization work. I believe that all money expended to increase membership is well used. I will very briefly review some of the work of the various officers, the details of which will be given in their respective reports.

The Illinois Association has had the largest amount of money for organization purposes, and as the result of the energetic and thorough work of two self-sacrificing officers of the Illinois Association, John M. Simpson, president, and Jno. O'Neil, Jr., secretary, \$346 in national dues have been collected by them and forwarded to the national financial secretary. Last year there were only 30 affiliated members in Illinois outside of Chicago, and to-day there are 173, or an increase of 143 members. This does not include the North Shore Association, which disbanded and most of its members joined the Chicago Association.

Through the efforts of your national treasurer, the State vice-president of Wisconsin and the secretary of the North western Association of Wisconsin (W. S. Pattison) there is a good State association in Wisconsin and an increased membership in the State of 80 members.

The State vice-president of Maine, John B. Smith, assisted by Robert J. Donnelly of Portsmouth, N. H., organized three new local associations and a State association. The local associations are: Bangor and vicinity, Portland and vicinity, and Augusta and vicinity, and with the Lewiston association, organized last year by Mr. Smith, make a membership in Maine of 43.

James H. O'Neill of Lincoln, Neb., who for years has been struggling for a State association, has had his efforts crowned with success. Your national vice-president, L. B. Cross, assisted Mr. O'Neill at a meeting in Lincoln, on February 14 last, in forming a State association, which now has 34 members.

A State association has been formed in Florida with a charter membership of 18. Our Southern friends appear to be well organized, and judging from the correspondence and careful methods pursued in a case of dispute they mean advancement and protection.

J. A. Monagan of Eureka Springs, Ark., has met with very flattering success in his State. On October 16 last he called a meeting of the master plumbers of Arkansas at Little Rock, and as the result of his efforts a State association was formed with 33 members.

Learning that there was a large field for organization in the Eastern part of Pennsylvania and that the national State vice-president of Pennsylvania did not have the time to devote to the work I felt the field should not go uncultivated, especially as several had written for personal assistance. Jas. F. Traynor of Wilmington, Del., was in my office one day and I spoke to him about the situation and he offered to do anything in his power to advance the work. So I instructed him to go ahead and do the work, using his best judgment. John Trainor of Baltimore, Md., assisted Mr. Trainor in Harrisburg. As the result of Mr. Traynor's work associations were formed in the following places: Scranton, 21 members; Allentown, 19 members; Harrisburg, 15 members; Lancaster, 9 members; Chester, — members; Wilkes-Barre, 13 members. An association was formed in Easton with — members, and is the result of the missionary work of the Allentown association. Another new association in the Keystone State is Erie, which I understand was organized through its own efforts. The total increase in membership in Pennsylvania in new associations is 75.

The State vice-president of New Jersey, John Hickman, has labored hard and earnestly in his State, and had he not met with a painful accident which confined him to his bed and at a time when he was about to finish up the work begun he would have been

able to report most excellent success, but as it is he is able to make a much better report than many State officers who have had their health. Mr. Hickman has been very ably assisted by Alex. Don of Newark. Hardly a master plumber in the State of New Jersey has not received a personal call from one of these workers. Monmouth County (including Asbury Park, Red Bank, Long Branch, Ocean Grove and Sea Bright) was organized with 12 charter members. Plainfield with 11 members. Hudson County with 30. Several other cities have been visited, but on account of Mr. Hickman's illness the associations have not been organized.

The State vice-president of Oregon, L. H. Buddemer, has held a revival in his city, Portland, and reorganized the association. He has also engaged in some preliminary work outside his city, and requests that he be continued in office for another year so that he may complete the work begun.

The following is a list of the associations formed during the year and the number of members in each which have affiliated with the national association:

Northampton, Mass.	18
Monmouth County, N. J.	6
Harrisburg, Pa.	19
Scranton, Pa.	21
Wilkes-Barre, Pa.	13
Chester, Pa.	—
Erie, Pa.	11
Easton, Pa.	—
Lancaster, Pa.	9
Hudson County, N. J.	15
Yonkers, N. Y.	14
Omaha, Neb.	21
Lincoln, Neb.	6
Marquette, Mich.	4
Green Bay, Wis.	4
Janesville, Wis.	4
La Crosse, Wis.	4
Madison, Wis.	5
Bakersfield, Cal.	9
Bangor, Maine	4
Augusta, Maine	10
Portland, Maine	6
Plainfield, N. J.	11
Galesburg, Ill.	4
Aurora, Ill.	4
Bloomington, Ill.	6
Joliet, Ill.	5
Springfield, Ill.	8
Rock Island and Moline, Ill.	10
Elgin, Ill.	6
Danville, Ill.	5
Ottawa, Ill.	5
La Salle and Peru, Ill.	5
Jacksonville	4
Mendota, Ill.	4
La Grange, Ill.	4
Streator, Ill.	4
Waukegan, Ill.	4
Somerville, Mass.	14
Cambridge, Mass.	12
Minneapolis, Minn., reorganized	22
Portland, Ore., reorganized	28
Florida Association (State)	18
Arkansas Association (State)	35

New individual members.....137

WEAK ASSOCIATIONS.

In noting the increase of new associations I feel it my duty to call attention to the old associations, or those in existence but a year or so, and their dropping out. Whatever the cause of the defection may be it is a mystery. The usual replies to inquiries as to the cause are that meetings have not been held for one, two, three or more months, and that when meetings were held a quorum was not present. Further inquiries will elicit no more information than that the members will not work together. What means can be adopted to induce or make members work together is the question, and the member who solves it will render a valuable service. Reports of filial associations where all personal differences are cast aside and all united in the common cause, and what should be the most convincing, reports of better work and living prices, avail little in convincing such lukewarm supporters of organization that

success depends upon the honest efforts of all members and not upon one or two. During the year several associations that have dropped out have been helped by the National Association and yet they have not seen fit to support their benefactor in the work. There are several local associations in the State of New York that have been organized and reorganized and now want to be reorganized again. Sometimes associations will start out and make mistakes in their early existence and need to be put on the right track, but when they want a national organizer every year I fear they can never be of much benefit to themselves or a credit to the National Association. Surely the dropping off cannot be attributed to any lack of attention or protection at the hands of the executive officer or of the protection policy. No complaints are made but what receive the prompt and careful attention of the national officers. Associations that have violations of the Baltimore resolutions and will put the evidence in the hands of the National Association and will do its part will be satisfied with the results. The impression seems to prevail among some members that they only have to write in that Mr. Manufacturer has sold a bill of goods to a consumer. Let me say to all such that they have a duty to perform, and that if they will do their part the National Association can be of great benefit to them.

SANITARY LEGISLATION.

I have watched with much interest the laudable efforts in the various States in the furtherance of State legislation in the interest of sanitary plumbing and competency on the part of master and journeymen plumbers. New York has successfully passed through this work, and I know what opposition is to be encountered on the part of avaricious landlords, who have too little regard for the health of their tenants, as well as from a few master plumbers, who fear they do not know enough about plumbing to pass an examination as to their competency. I have called the attention of the National Legislative Committee to this question and I hope it has prepared a report, enumerating the laws sought to be enacted and their cardinal points. I believe such a report would be most interesting to us all. I sincerely regret that the efforts of my colleagues have not been as successful as desired. Where success has not crowned your efforts I trust hope has not fled, but that your temporary defeat, for it can be but temporary, will urge you onward to success.

VISITS OF THE EXECUTIVE OFFICERS.

During the year the executive officers have made the following visits on behalf of the National Association:

John Trainor of Baltimore visited Harrisburg, Pa., and assisted in the formation of the Harrisburg Association. He attended the State conventions of the Massachusetts and Rhode Island Associations. Also visited Philadelphia to adjust a complaint.

The Cincinnati Association desired the presence and advice of a national officer, and Mr. Dewstoe attended a meeting of their association.

The Cleveland association requested the attendance of a national officer at one of their meetings, and Mr. Meathe made them a visit.

Your national vice president visited Lincoln, Neb., and assisted in the formation of the Nebraska association.

Your national treasurer visited St. Paul and Minneapolis, Minn., to advise and encourage the associations there. He also visited several other places in his State.

During the year I have visited the

following places: Connecticut State Convention, at Waterbury; New York State Convention, at Troy; meetings for organization in Asbury Park and Elizabeth, N. J.; a meeting of the Newark Association; convention of the American Public Health Association in Montreal, Canada. Mr. Pattison accompanied me to the Newark meeting.

Mr. Crosby, the executive clerk, has visited the following cities in the interest of the association: Boston and Northampton, Mass.; Elizabeth, N. J.; Newark, N. J., four times; Paterson, N. J., twice; Waterbury, Conn.; Baltimore, Md.; Springfield, Mass.; Montreal, Canada.

This year the proceedings of the last convention were mailed direct to each member within seven weeks after the adjournment of the convention. I believe this the most satisfactory way of distributing the minutes of our conventions.

Extra copies of the essays of Mr. Sheehan and Mr. Dibble, on "Organization of master plumbers' associations and the proper limit of their actions," also copies of the constitution and by-laws, were printed at the time the proceedings were printed, and, by using the same type used for the proceedings, cost but a small sum. This extra printing was used in organization work.

The correspondence of the year has been in excess of that of previous years; 1735 letters have been sent out; 900 mimeograph circulars have been prepared and sent out.

THE PAST AND FUTURE.

The results of the past year have been briefly given to you. I must admit that the Baltimore resolutions, as modified and interpreted by the national Executive Committee at the meeting held in New York City, to be the platform for the future for all sections of the country, and one that will do the most good and unite the master plumbers and manufacturers for business success. This year make your platform a permanent one for the future, so that all may understand and live up to it honestly as a contract on both sides. As our association is conducted on the principle "the majority to rule," do at this convention what will best serve the many and be safe for the members of this association to pursue. The moderate, conservative course I urge upon you may not suit the radical members who would rather rule than serve, even at a cost of dismemberment and ruin. What is wanted is to enroll every master plumber doing business throughout this land and the adoption of a uniform platform that can be maintained by all and in all sections, which will give the officers the hearty support of all local associations and individuals. When complaints are made of any violations the same should be supported by facts and not hearsay assertions, which cause endless trouble and humiliation to the officers. Do your duty well and increased membership and influence will follow, and our grand National Association—the infant of 13 years ago and the pride of those who brought it into life—will continue to live and accomplish all that was expected by its most sanguine friends.

Let me counsel you all, from Maine to California and the Lakes to the Gulf, to be patient and finish your labors, all uniting in one great movement for the protection and future life of this gathering, the benefit of humanity, the saving of lives, maintaining the happiness of those left behind, giving all beautiful work, approving all good sanitary appliances that beautify the private and public buildings throughout this progressive country, as an example to the youth of our

country and encouragement to take up the many things by us undone. If you do but half your duty no member will have cause to regret his alliance, but will hail with pleasure the high honor of being allied to this grand National Association.

Let your annual conventions be conducted in a businesslike way, free from intemperance, show and disorderly display. Maintain ourselves locally and nationally as regards social pleasures at conventions, exempting the manufacturers from expense, providing ourselves with social enjoyment at our own expense, and as a matter of principle; if we are unable to entertain ourselves let us do without it until we are. Do this and we will command the respect which dignity and independence always insure to the individual and association alike.

On retiring from this great office I wish to publicly thank the members of the Executive Committee of the year, who so gallantly stood by me, and to whose energy is due this great gathering to day. I would be doing an injustice in closing without assigning to Mr. Crosby, the executive clerk of the association, great praise for faithfulness, energy and help during every day of my term.

On retiring I am, a believer in the maxim, rotation in office. New blood is the best to command and build up, without regard to any section. The officers should possess merit, honesty and general good financial standing, and thereby command respect from friends and foes.

The report was listened to with much interest, and at the conclusion of the reading John Trainor of Baltimore moved that the report be received and spread upon the minutes and that the recommendations mentioned in the same be referred to a special committee, with instructions to put them into shape for adoption by the association. The motion being carried, the president appointed the following committee:

John Trainor, Baltimore.

Robt. Griffiths, Chicago.

Isaac Riley, Boston.

John O'Neil, Jr., Peoria.

Saml. Malcolm, New York.

The president's report of his visit to Montreal last December as a delegate from the association to the convention of the American Public Health Association was then read and a motion by J. J. Wade carried that the report, with the papers referred to in the same, read at the convention and appended to the report, be printed in the proceedings of this convention.

J. L. McShane, as vice-president of the State of Pennsylvania, reported the formation of a number of new associations throughout the State. The State Association was in excellent shape and had been successful in obtaining the passage by the Legislature of some good sanitary measures.

W. J. McDermott satisfactorily accounted for the non-appearance of a report from the State of New York; and P. Tierney asked permission, which was granted, to present the report of the Rhode Island Association in executive session.

Geo. E. Howe, for Southern California, reported that his association was in a very thriving condition.

T. H. Radcliffe, chairman of the Apprenticeship Committee, stated that his committee had no report to make, the business of the committee having been undertaken by the Executive Committee.

W. H. Doyle, Philadelphia, then, on behalf of the Philadelphia delegation, in a neat speech, presented to the association a large national flag for display at convention headquarters or elsewhere. The flag was of large size and on its outer end bore the title of the association. President Mitchell, on behalf of the association, acknowledged the gift in suitable terms, and the convention showed its appreciation of the gift in rousing cheers.

The meeting then adjourned to meet on Thursday morning at 9 o'clock in executive session.

Immediately after adjournment the delegates repaired to the front of the theater, where they were photographed.

In the afternoon the delegates and ladies were taken by the members of the Philadelphia Master Plumbers' Association to the Race street wharf, where they embarked on the steamer "Channey Vibbard" for a trip to Cramp's Shipyard and to Lincoln Park on the Delaware, the programme including a banquet at the latter place.

THURSDAY.

The convention met at 10 o'clock in the morning in executive session, which was continued until 5:30 in the afternoon, when open session was declared. The Executive Committee's report was then read.

Report of the Executive Committee.

During the year your Executive Committee has held three meetings. The first meeting at St. Clair Springs, Mich., June 22, 1894, and the second meeting at 155 East Fifty-eighth street, New York City, on October 15 and 16, 1894, and the third meeting at the Continental Hotel, Philadelphia, Pa., June 10, 1895.

FIRST MEETING.

The first meeting, held at St. Clair Springs, was called to order by President John Mitchell, with the following members present: John Mitchell, New York City; L. B. Cross, Kansas City, Mo.; W. E. Goodman, Milwaukee, Wis.; Henry J. Pattison, New York City; Henry G. Gabay, New York City; John Turner, Baltimore, Md.; C. C. Dewstoe, Cleveland, Ohio; James Meathe, Detroit, Mich.; Dan J. Finnerty, Boston, Mass.; Paul Redieske, Chicago, Ill. The first business was the appointment of an Auditing Committee, composed, as is usual, of the president, vice-president and retiring president.

It was moved and seconded that the chair appoint the regular standing committees. The Printing Committee was appointed, consisting of the president and secretary. It was voted that the *per capita* tax should be \$2 per member, the call for the first 50 per cent, to be issued on November 1, 1894, and the second call on March 1, 1895. The misunderstanding between the Los Angeles Association and three supply houses of California, as presented by the Los Angeles delegation at the Detroit convention, was referred to the president, with instructions to take such proper and effectual action as he deemed wise. The

Baltimore resolutions signed by J. L. Mott Iron Works and Fred Ade & Co. were referred to the president and such immediate advisers as he deemed essential. It was voted that the salary of the executive clerk hereafter be \$20 per week. Meeting adjourned subject to the call of the chair.

SECOND MEETING.

The second meeting of the Executive Committee was held in New York City on October 15 and 16, 1894, with President Mitchell presiding and the following members present: John Mitchell, New York City; Henry J. Pattison, New York City; W. E. Goodman, Milwaukee, Wis.; John Trainor, Baltimore, Md.; Henry G. Gabay, New York City; James Meathe, Detroit, Mich.; Paul Redieske, Chicago, Ill.

The following members were absent: C. C. Dewstoe of Cleveland, Ohio; L. D. Cross, Kansas City, Mo.; D. D. Finnerty, Boston, Mass. After the reading and approval of the minutes of the previous meeting, telegrams were read from Messrs. Dewstoe and Cross expressing regret at not being able to be present on account of important business engagements.

The question of accepting the position taken by the J. L. Mott Iron Works and Fred. Ade & Co.—which was that, inasmuch as they have signed an agreement to the authorized representatives of the National Association, Daniel G. Finnerty, that the agreement, coupled with later correspondence and telegrams, reserved to them the right to sell plumbing material to the following in any city of the Union: State and county institutions, railroad companies, Sailors' Snug Harbor, water, gas and electric light companies for such goods as are necessary for their respective lines of business, departments of cities and counties, the United States Government, for the export trade—was carefully considered by the members of your committee present at the meeting, and it was unanimously voted that inasmuch as ex-President Finnerty had interpreted the exceptions to the Baltimore resolutions made for the State of New York to apply to every State in the Union, and had granted had them to firms in New York, that this Executive Committee adopt the said exceptions and grant them to all manufacturers and dealers throughout the United States who have or may hereafter sign the Baltimore resolutions. It was voted that a sub-committee of the Executive Committee be appointed to interpret the exceptions granted, correct errors and prepare amendments to the Baltimore resolutions, the amendments to be reported to the convention for approval. Messrs. Trainor, Meathe and Redieske were appointed as the committee.

The Committee on Interpretation reported the following exempt from the operation of the Baltimore resolutions, which were adopted unanimously by the Executive Committee: The United States Government, State, county and city institutions, Sailor's Snug Harbor, railroads, gas, water and electric light companies for such goods as are necessary for their respective lines of business. The above resolution to apply to every State in the Union.

The Committee on Interpretation reported the following amendments to the Baltimore resolutions: That the first, second and fourth "resolve" in the Baltimore resolutions be struck out, and in the place thereof the following inserted as the first resolve:

Resolved, That members of this association confine the purchase of plumbing material to manufacturers and wholesale dealers who sell goods to master plumbers only, as defined in these resolutions.

The president explained how a certain

supply firm had sold plumbing goods to a railroad company, and that the goods were for private use, and further, that the firm complained of took the stand that they had a right under the Baltimore resolutions, with exceptions granted them, to sell to railroad companies regardless of where the goods were to be used. The president read a letter sent to the firm in question stating that such action was contrary to the spirit of the resolutions, and that while the railroad companies had been exempted it was very unfair for it to sell the goods to employees, and it was hoped that the countenancing by the supply firm of such action on the part of the railroad company would not continue.

President Mitchell explained that he and the executive clerk had called on Mr. Colgate of the National Lead Company of New York City relative to securing the signature of said firm to the Baltimore resolutions, and that Mr. Colgate said that his firm was in full sympathy with the resolutions, but was not in a position to sign them, and hoped that the association would consider him as working under the Baltimore resolutions. The Executive Committee voted that as long as the firm lived up to the Baltimore resolutions no action should be taken.

A communication was read from the Central Supply Association to the effect that the Central Supply Association would be pleased to confer with the National Association of Master Plumbers upon any question of interest to the trade. The president was instructed to thank the Central Supply Association for its offer of conference, but that at present the National Association of Master Plumbers has no questions to confer upon.

A letter was read from the State vice-president of Illinois, Robert London, asking for \$200 or \$250 for organization work in the State. Mr. Mitchell explained that Mr. O'Neil, secretary of the Illinois association, had been allowed \$136, the amount of *per capita* tax then collected by the Illinois association, for the use of himself and Mr. London in further organization work. The committee approved Mr. Mitchell's course.

Mr. Mitchell explained how essential it was that all copies of the Baltimore resolutions, bearing the signatures of those approving them, should be on file in the national executive office for reference, inasmuch as the resolutions were national in character. The Executive Committee approved of this course as most wise, and recommended that the president collect all copies bearing signatures.

It was moved by Mr. Goodman and seconded by Mr. Redieske, that the Executive Committee recommend to this convention that the bond of the national treasurer be increased to a sum not less than \$5000, as in the discretion of the Executive Committee it might seem best, and that the surety be in a responsible guarantee company, and the fee for same be paid out of the treasury of the National Association; also, that the bond of the financial and recording secretary be increased to a sum not less than \$2000 as in the discretion of the Executive Committee might seem best, and that the surety be in a responsible guarantee company, and that the fee for same be paid out of the treasury of the National Association. The motion was unanimously adopted.

Relative to paying bills incurred by the Special Committee on Revision of Constitution and By-Laws, appointed by the last convention, President Mitchell stated that he had personally advised Edw. Hayward, chairman of the committee, that he did not think it was the sense of the convention that it was necessary to call a special meeting of

the committee for the special purpose of considering proposed amendments, until a few days before the Philadelphia convention; and furthermore, that he did not consider he had the power from the convention to pay the bills likely to be incurred by such meeting, and that if any expenses were incurred the committee would have to appeal to the Philadelphia convention for the payment of their bills; and that notwithstanding these facts, Mr. Hayward called a meeting of the committee in Philadelphia on Sept. 2, and had sent bills aggregating \$121, and that he understood another meeting would be called for the same purpose. It was moved by the committee that the bills be referred to this convention for payment.

The president and secretary were instructed to act as a committee and consult with the Philadelphia Association relative to preparations for this convention. The second Tuesday in June was designated as the day for the opening of the convention, but that if the Philadelphia Association desired it could be changed to the third Tuesday. The president and secretary were also designated as a committee on transportation to secure reduced rates to this convention, also to select and secure badges for delegates. It was also thought advisable to issue tickets of admission to be issued only to delegates, in order that only delegates should have admission to the convention floor.

It was unanimously voted that the recommendation contained in the report of the state vice-president of Rhode Island, to provide for the appointment of a national organizer, be non-concurred in, because the president had the right to appoint any member of the National Association to organize in any section. The non-compliance with the Baltimore resolutions on the part of Chambers & Inslee of Newark, N. J., reported by a member from Bethlehem, Pa., was considered and the president instructed to write to the Newark firm and also the Newark Association, which the president did. The firm has since signed the Baltimore resolutions.

The assistance asked for by the Kansas Association at the last convention was considered and the president instructed with full power to act with the Kansas Association in carrying out the spirit of the Baltimore resolutions. The Kansas Association was communicated with, but no line of action was suggested.

President Mitchell explained that the Texas Association did not desire the membership of a certain land booming concern which claimed to be in the plumbing business, and that a certain manufacturer claimed that the firm was in the plumbing business and should be admitted to membership. That he had received a call from the manager of the supply firm, and that the manager agreed to abide by the decision or opinion of your president as to the fitness of this so-called plumbing firm for membership in the Texas Association. President Mitchell rendered his opinion that the Texas Association had a perfect right to sit in judgment upon the qualifications of the candidates for membership. This opinion being sent to the supply firm in question, was acknowledged and agreed to, which settled the matter.

In relation to the statement of John Crimins of Los Angeles and John L. E. Firmin of San Francisco that certain supply houses in California were conducting a plumbing supply business and a plumbing business, it was thought advisable to recommend to the convention as the sense of the committee that supply houses doing a plumbing supply business and contracting for plumbing work should be

considered unjust competitors. The president outlined the pernicious effects of members of the association selling plumbing material where they did not do the work, and it was moved by Mr. Trainor and seconded by Mr. Redieske, and adopted as the sense of the committee, that a member of the National Association should not sell material to parties excepting to those who had a right under the Baltimore resolutions to purchase same, and that the committee recommend to this convention an amendment to the Baltimore resolutions covering this point. The motion was adopted unanimously.

Mr. Trainor stated that the Baltimore delegation at the Detroit Convention was instructed to present the name of the supply firm of Baltimore that would not sign the Baltimore resolutions, but that owing to other business it was crowded out; also that a Boston firm were selling plumbing material to non-licensed plumbers in Baltimore, in violation of the Baltimore resolutions. It was the sense of the committee that the president should write to the Boston firm that their goods were being disposed of to others than licensed plumbers. The president corresponded with the firm in question, also the Boston association, and the matter was amicably adjusted.

Mr. J. Leland Wells, chairman of the Executive Committee of the Master Steam and Hot Water Fitters' Association, and P. G. Monroe, clerk of same association, appeared before your committee to urge the co-operation of the National Association of Master plumbers in matters pertaining to the protection of both trades, principally to influence manufacturers and dealers in plumbers' steam and hot water fitters' supplies to confine their sales to those regularly engaged in the business.

Mr. Wells said that his association would exert its influence to induce manufacturers of plumbing goods to deal with plumbers only, if the Master Plumbers' Association would exert a like influence with firms dealing in their line of goods. Mr. Wells said that in the case of iron pipe and fittings his association could afford protection. Mr. Wells thought by a joint committee of the two associations that considerable mutual good would result. After considering the proposition stated by Mr. Wells it was the sense of your committee that at present co-operation with the Master Steam and Hot Water Fitters in the manner desired was not prudent, and that it was best to refer the letter to this convention for careful consideration. It was moved by Mr. Meathe and seconded by Mr. Trainor that the president publish through the medium of the trade press in the form of an interview for the benefit of manufacturers and dealers, that inasmuch as the National Association was a business association, convened for business at annual conventions and not for a frolic, that the presence of agents for manufacturers and jobbers who apparently attended the convention for the purpose of a frolic was distasteful to the National Association and conveyed to the public a wrong idea of the association. The motion was adopted unanimously.

President Mitchell explained that, in compliance with a resolution passed by the last convention providing for the appointment of a committee to confer with the United Association of Journeymen Plumbers on the question of apprenticeship and to formulate some rules on the subject to recommend to the Philadelphia convention, he had notified the United Association of Journeymen Plumbers. The following gentlemen appeared before the Executive Committee in behalf of their associa-

tions: J. H. Connolly, chairman, Worcester, Mass.; W. J. Spencer, Buffalo, N. Y.; N. J. Driscoll, Brooklyn, N. Y.

After discussing the matter in joint conference, the following proposed rules were unanimously approved, to recommend to this convention.

SECTION I.—Any person desiring to learn the trade shall not be under 16 years of age, shall be of good moral character, able to read and write, and understand the rudiments of arithmetic, and must serve a term of five years, of which three should be served in the capacity of helper, the remaining two years to be employed at the discretion of the employer.

SEC. II.—That any person so apprenticed shall be properly indentured.

SEC. III.—Apprentices taken upon the conditions herein named shall be allowed six months probation, to properly determine the merits or qualifications of apprentices, which shall be allowed; the apprentice term provided said apprentice is accepted at the expiration of said period of probation; and further provided that the conditions named in Section II have been complied with.

SEC. IV.—Two apprentices shall be allowed to every four journeymen or fractional part thereof. In shops where they have only one apprentice, an additional apprentice will be allowed at the end of each year.

SEC. V.—All journeymen shall use their best endeavors to properly instruct apprentices in the art or knowledge of the trade.

SEC. VI.—Since the employment of the apprentice depends largely upon the journeyman, he, the journeyman, shall be consulted as to the merits or qualifications of said apprentice at the expiration of the probation period.

SEC. VII.—Detractions from conditions herein named shall only be made by reference of the entire controversy to the National Apprenticeship Committee, which shall consist of the Executive Committee of both the National Associations.

THIRD MEETING.

The third meeting of your Executive Committee was held at the Continental Hotel, at Philadelphia, Pa., June 10, 1895. Meeting called to order by President Mitchell with the following members present: John Mitchell, New York City; L. B. Cross, Henry J. Pattison, W. B. Goodman, Daniel G. Finerty, Paul Redieske, C. C. Dewstoe, Henry G. Gabay, James Meathe, John Trainor.

The secretary read the minutes, which were objected to by Mr. Finerty, who claimed that there was an error in that part of the proceedings where it referred to the granting of exceptions to J. L. Mott Iron Works and Fred. Adee by him. Mr. Finerty claimed that the exceptions were granted by the Executive Committee, and for the whole United States. The members of your committee, with the exception of Mr. Finerty, claimed that the exceptions when first proposed were understood by them, according to the wording of the documents signed by the two firms, to be only for the State of New York. Correspondence from the members of the Executive Committee to Mr. Finerty, also the correspondence between Mr. Finerty and the two firms, were read, which proved conclusively that at first Mr. Finerty evidently considered the exceptions were only for the State of New York, but later telegraphed to the two firms that the exceptions were for every State in the Union. The minutes as read by the secretary, which stated that the exceptions for the whole United States were granted by Mr. Finerty, were approved. President Mitchell read a letter from the Standard Mfg. Company of Pittsburgh in which said firm objected to putting on the list of manufacturers and jobbers in accord with the Baltimore resolutions the names of agents, for the reason that said agents were not considered jobbers of plumbing supplies. Presi-

dent Mitchell replied to the Standard Mfg. Company that in his opinion an agent residing in Pittsburgh or in any other city who sold plumbing material, though he did not carry perhaps a large stock, and might be merely an agent for some manufacturer, was entitled to a place on the list, for the reason that the said agent, if he did not sign the resolutions, could sell plumbing material to consumers, to the injury and detriment of the master plumber, and an injustice to the manufacturer, who perhaps had refused to sell to a consumer. The Standard Mfg. Company expressed a desire to write further on the subject, for the consideration of the committee, but no reply has been received.

A communication was received from the Monitor Iron Works of New York calling attention to prison made plumbing goods and urging the association to take some action disapproving prison made goods. It was moved by the Executive Committee to recommend that the National Association condemn all prison made goods. It was unanimously voted to appropriate \$500 to offer the Philadelphia Association for use toward defraying the expenses of the convention, such as hall, &c.

It was the sense of the committee that it recommend to the convention that members of the National Association would sell no plumbing goods to consumers other than those that they or their workmen put in.

At the conclusion of the reading the report was, on motion, received and adopted, with the exception of the portion covering the apprenticeship question.

During the reading of the report a committee from the convention of the Master Steam and Hot Water Fitters, composed of C. J. Gillis and J. W. Mills, appeared on the floor and tendered greetings and good wishes from their convention then in session. The committee were enthusiastically received and departed amid applause.

C. J. Prescott, vice-president of the Kansas State Association, reported a satisfactory state of affairs in his association and that it could be depended upon to support all measures tending to promote the trade.

Florida, through its delegate, reported that its State Association had only been formed within the last twelve months and rejoiced in 19 members, the State's complement of plumbers, all of whom were working in harmony.

E. J. Hannan then made a motion, which was carried, that the report of the Committee of the Whole, presented in executive session, be adopted.

W. G. Hayward of Brooklyn, Chairman of the Committee on Revision of the Constitution and By-laws, then read the amendments to the constitution and by-laws recommended by his committee on the lines laid down at the Detroit Convention. After a lively discussion, during which many motions were made, the matter was, on motion of Wm. McCoach, indefinitely postponed, a division being taken resulting in a vote of 145 to 59 in favor of postponement.

On motion, the Committee on Resolutions were then ordered to report, and the following resolutions passed:

A resolution expressing the desire of the members of the association that all

manufacturers of ball and basin cocks supply the same having standard iron pipe threads to the supply connections.

A resolution that a master plumber performing work in other jurisdictions than his own must be governed by the rules of the association covering such district.

A resolution recommending the aid of the associations represented at the convention to support the Washington, D. C., master plumbers in their efforts to obtain the passage of a bill requiring that the plumbing inspector of their city be a master plumber. The resolution also directed that a copy of the resolution in full be presented and distributed to all members of the association.

A resolution ordering the expenses incurred by local associations in entertaining the National Association to be paid out of the national treasury, such expenses not to exceed a sum set apart by the National Executive Committee.

A resolution that the association request his Excellency the Governor of Pennsylvania to sign House Bill No. 23, authorizing the regulation of house drainage, the construction of cesspools and the registration of journeymen and master plumbers; also the act for providing for the establishment of a Bureau or Division of Plumbing and House Drainage on the Departments of Health in cities of the second class of the Commonwealth of Pennsylvania.

A resolution recommending members of the association to insist that they be paid by manufacturers or jobbers for removing or replacing any article or fitting found defective after water has been turned on.

The convention then took a recess until 8 o'clock.

THURSDAY EVENING

The convention was not called to order until 8:45 o'clock. The first business was the reading of the financial secretary's report. Upon conclusion of the reading the report was, on motion, referred to the Auditing Committee.

W. J. McDermott of New York moved that the proposed resolution amending Article 4 of the constitution, referred to the Committee on Revision of Constitution and By-Laws, be reported on by that committee, and the motion was carried.

W. G. Hayward, as chairman of the committee, stated that the report was covered by the resolution passed at the afternoon session postponing indefinitely the contemplated revision.

Mr. McDermott claimed that the resolution referred to, which was that "all local associations and individual members must be affiliated with their respective State associations, where such exist, in order that they be recognized by the National Association," was separate and distinct from the resolutions previously acted upon.

The point taken being sustained, considerable discussion took place, the resolution finally being placed before the meeting as a motion by Mr. Mc-

Dermott, made in the manner prescribed by the constitution, and voted on. The result of the vote being doubtful, a division was called for, resulting in the adoption of the resolution by a vote of 194 to 75.

The following resolution was presented by the Committee on Resolutions, and on motion carried:

Whereas, Considerable of the plumbers' earthenware now in the market is of very inferior quality and crazes in a very short time, the connections as now made being very poorly constructed and very often falling to pieces after being set in place, thereby causing plumbers considerable annoyance and expense; therefore be it

Resolved, That the National Association of Master Plumbers do hereby request that all manufacturers of earthenware do place their name upon their goods and guarantee the same, and that it is the sense of this association that plumbers will not use any earthenware not so stamped and guaranteed.

C. Sullivan of Newark, N. J., then offered the following resolution, which was carried:

Resolved, That this convention authorize its Executive Committee to act with the Executive Committee of the National Master Steam and Hot Water Fitters' Association for mutual protection to the trade when it is found that the Baltimore resolutions or the "Trade resolutions" have been violated by manufacturers who have signed either of the above resolutions.

The treasurer, W. E. Goodman, then made his report, which showed that the total receipts during the year were \$11,125, and the expenditures \$4827, leaving a balance in hand of \$6298. The report was referred to the Audit Committee, who afterward reported it correct.

P. M. Murphy then moved that in view of the liberal treatment received at the hands of the Philadelphia local association, and the large amount in the treasury, a further sum of \$500 be voted them toward expenses.

Jere. Sheehan moved, as a substitute for the motion, that the matter be referred to the Executive Committee. The substitute was carried.

Election of officers for the ensuing year being then in order, the president called for nominations, and appointed as tellers Jas. Gilroy of New York, P. A. Sullivan of Baltimore, and John O'Neill of Illinois.

Candidates for president were nominated as follows: W. H. Doyle of Philadelphia, by John L. E. Firmin, and James Meathe of Detroit, by C. C. Dewstoe. The qualifications of each candidate were set forth in an eloquent manner by the gentlemen making the nominations and others. The ballot resulted in the election of Jas. Meathe, who mounted the rostrum and suitably expressed his thanks for the honor conferred on him.

For vice-president, P. Tierney of Providence, R. I., Wm. McCoach of Philadelphia, W. H. Doyle of Philadelphia, Thos. Culloton of Chicago, L. B. Cross of Kansas City, and Thos. H. Radcliffe of Brooklyn, were nominated. Mr. Radcliffe being the only nominee

accepting the nomination, the secretary, upon motion, was directed to cast one ballot for him, thus making the election unanimous.

The place for holding the next annual convention was then considered, and Cleveland was the unanimous choice.

The names of the State vice-presidents decided upon by the association were then handed in, as follows:

Arkansas, J. A. Monahan.
Southern California, Geo. E. Howe.
Northern California, James E. Britt.
Connecticut, A. J. Clerkin.
District of Columbia, James Cunningham.
Illinois, J. B. Breen.
Iowa, John Burnside.
Kentucky, A. M. Ramsey.
Maryland, J. C. Mitchell.
Massachusetts, J. F. Deedy.
Michigan, W. C. McGurrin.
Minnesota, Geo. A. Pease.
Missouri, Richard T. Connell.
Nebraska, John Rowe.
New Jersey, C. Sullivan.
New York, W. G. Reid.
Ohio, L. Poplowski.
Pennsylvania, John A. Kramer.
Rhode Island, Patrick Tierney.
Texas, W. H. Otter.
Wisconsin, W. H. Halsey.

E. J. Hannan then made a motion, which was carried, that the State vice-presidents mentioned be named as a whole, and that the States not appearing in the list have their presiding officers appointed by the incoming Executive Committee.

W. E. Goodman was unanimously re-elected treasurer.

Jas. Crumley of Detroit was the selection for secretary, the appointment being indorsed by the convention.

The president announced the following members of the Executive Committee:

L. B. Cross of Kansas City.
T. P. Culloton of Chicago.
D. G. Finnerty of Boston.
C. C. Dewstoe of Cleveland.
W. H. Doyle of Philadelphia.

After a vote of thanks to the retiring officers was taken, the convention adjourned *sine die* at 12 p. m.

Jets and Sprays.

FRANK R. HALL, C. HALL and GEO. W. PRATT represented Samuel Hall's Son, New York, and showed Hall's improved pipe wrench and pipe clamp for using the wrench on brass and plated pipe. A scale is on the jaw of the wrench for setting to suit any size of pipe, and it is so constructed that it does not jam and fasten on the pipe, but releases immediately.

G. F. HICKMOTT gave a pleasing reminder of the Birkery Mfg. Company, Hartford, Conn., in a neat match safe bearing a cut of the Birkery ball cock.

A HANDSOME EXHIBIT of sanitary earthenware was made by the Keystone Pottery Company, Trenton, N. J., in charge of Walter Lyon. A space 10 feet on the wall was decorated with round, square and oval lavatories ornamented with flowers and gilt. On a platform in front of the lavatories, washout, hopper and siphon closets were shown, some, plain and others hand-

somely ornamented in relief designs in colors and gilt. J. H. Lyons, J. A. Umpleby and J. Brian were also at the convention.

THE LEAD LINED IRON PIPE COMPANY, Wakefield, Mass., made an elaborate display of their lead lined iron pipe and fittings on a specially designed display stand in charge of Thomas E. Dwyer, who presented the delegates as a souvenir with a folding steel rule in a neat leather case. This exhibit was closely examined and the sectional samples gave a clear idea of the method of connecting and the security of the joint.

B. K. LOUGHLIN, representing J. E. Jeffords & Co., manufacturers of sanitary pottery, at 2715 Edgemont avenue, Philadelphia, extended an invitation to the delegates to visit their factory and witness the process of manufacture of plumbers' earthenware.

B. DALE, Milwaukee, Wis., exhibited a handsome nickel plated sample of the Dale patent flush tank valve, which is said to be adaptable for use with any closet and unaffected by dirt or lead chips.

THE DETROIT SANITARY SUPPLY COMPANY, Detroit, Mich., distributed catalogues of their clean sweep non-siphon traps and specialties in nickel plate, brass and lead.

C. P. MONASH represented the Van Aken Steam Specialty Company, Chicago, and distributed some attractive illustrations of Murphy's packless valve, which reminded the delegates of interesting experiences.

I. N. GLAUBER and A. M. BUCHMAN represented the Glauber Brass Mfg. Company, Cleveland, Ohio, and distributed a yellow silk badge bearing a miniature stop cock.

THE PHILADELPHIA HOUSE of the Craue Company, Chicago, had a display of steam and water valves, both globe and gate patterns, pop safety valves and some special fittings in charge of G. M. Bridgeman, F. W. Downs and A. H. Jones.

THOMAS HYDE, Albany, N. Y., presented the delegates with circulars of the Common Sense trap screw and the Dandy cleanout.

W. A. KELLY, Cleveland, Ohio, had an exhibition and distributed half-tone illustrations of the Electric siphon closet tank and the Kelly lock nut for basin cocks.

J. V. L. KLAPP of the Keystone Lead Works, Philadelphia, enjoyed the convention and made many new acquaintances.

THE MEYER-SNIFFEN COMPANY, 5 East Nineteenth street, New York, was represented by Marcus F. Ketcham, who met many old friends whose acquaintance was made when he traveled the whole country for their sanitary specialties.

J. D. STILES of New York and Harry G. Logan of Philadelphia greeted the many users of the Jenkins valves, made by Jenkins Bros.

DICK REED is the way this popular representative of the H. B. Smith Company, Westfield, Mass., is known to the users of steam and hot water boilers and radiators, of which the house make a large line.

R. M. WILSON, Rome, N. Y., was represented by J. O. Wilson of the New York office, at 92 Walker street. Nickel plated copper boilers and solid copper bathtubs are two specialties that were brought to the attention of the delegates.

THE TEMPLE VENT FITTINGS shown by Oliver Schlemmer of Cincinnati, attracted no little attention from the plumbers. By means of a partition in the fitting, which is introduced into the vent stack, the vent

from a fixture may run direct from the trap to the stack, as the partition runs up inside of the fitting above the top of the fixture. This avoids an unsightly display of pipes and some extra labor.

L. HASSINGER displayed a steel clad bathtub for the Steel Clad Bath Company, New York, and the new Trageser all copper sanitary baths for the John Trageser Steam Copper Works, New York. He had many visitors.

F. D. JOHNSON, in room 180, showed a model of the new Hersey steam and hot water heater made by the Hersey-Atwood Company, Clifton, N. J. All fire surface and vertical circulation was the claim made.

EDWIN S. MARSH, Chicago, had circulars of his open way sewerage and tide water valve where they caught the plumber's eye.

C. A. BRAY, 155 Eliot street, Boston, exhibited the Champion clamp machine for making straps of light sheet metal strips for securing the pipes of a plumbing system.

SECRETARY H. WARREN TERRY of the W. S. Cooper Brass Works, Philadelphia, and Frank T. Merwin talked Nautilus closets, aluminum baths and their line of sanitary specialties when pressed for information.

PECK BROS. & Co., New Haven, Conn., were represented by W. B. Hubbard of the Boston House and A. J. Purdue of New Haven, who were greeted gladly by the plumber, though nothing was said of their splendid line of plumbers' brass and nickel plated goods and sanitary apparatus and fixtures.

J. W. PARKER, 41 North Seventh street, Philadelphia, explained the merits of his noiseless exhaust to the heating plumbers.

W. T. HUDSON gave pointers that James W. Birkett, 351 Jay street, Brooklyn, made a splendid line of gas and electric lighting fixtures.

THE FOWLER RADIATOR MFG. COMPANY of Morristown, Pa., rented a room across the street from the hotel and made a fine display of their new Universal radiator, which can be extended as a wall coil, used as an indirect, as a direct-indirect, as a flue and as a bracket radiator. They were handsomely decorated and left an impression on the sightseers. E. P. Bates is using these radiators in the Masonic Temple at Albany.

H. ROMEYN SMITH, Syracuse, N. Y., made a fine display of plumbers' gasoline goods, showing the Junior and Imperial torches and the Hot Blast furnace for tinners and plumbers. The torches are fine specimens of brass work, and are adapted for wiping joints and seams, as well as thawing frozen pipes and melting off brass work.

THE F. W. FOSTER MFG. COMPANY, Boston, Mass., distributed "Something about Stamps and How to Get Them," in which all seemed interested. In a small envelope containing a moral about the Foster high pressure ball cock was a little booklet for keeping postage stamps and containing two pieces of court plaster. This was in the shape of a letter posted to the company and bearing in addition to the address the following: "Stick to the Foster and you will have stamps."

H. J. GLITCHER, representing the National Brass Mfg. Company, Cleveland, Ohio, showed a section of a lavatory with a patent waste and overflow arranged so that the overflow could be flushed. Catalogues

of the specialties of the company were presented to the delegates.

THE SOUVENIR COLLECTION of half tone engravings of the Continental Hotel was gathered by the delegates as a memento of a hospitality that was very agreeable.

A. EDWARD BRADLEY represented the Beaton & Bradley Company, Southington, Conn., and showed their chain pipe hanger and spring pipe clamp, distributing a neat price-list.

O. H. JONES had a fine display of the high pressure ball cocks made by the F. W. Foster Mfg. Company, Boston, Mass. They were shown in all sizes up to the new 3-inch cock, which is of special construction. These cocks have been used under a pressure of 245 pounds with satisfaction, and are made to stand 500 pounds.

PRESIDENT W. P. POWERS of the Powers Regulator Company, Chicago, and Percy MacCallum of the Boston house, explained the advantages of a system of regulation for all heating plants to many interested listeners.

T. VAN ETEN exhibited the manufactures of the Zero Valve Company, Buffalo, N. Y., showing the Zero and Vollmer Anti-freezing valves, a swing seat for hopper closets, and the new H. D. W. vent cap. He distributed a neat souvenir catalogue printed in colors, with covers of celluloid printed in red and blue and tied with a blue ribbon. Their exhibit attracted much attention, the anti-freezing stop and waste valve particularly.

THE A. WILHELM COMPANY, Reading, Pa., distributed "a plum for the plumber" and "a gauge for the steam fitter" in a neat circular showing a *fac-simile* of the can with the label of their aluminum elastic cement for pipe fitting.

JAMES W. TEMPLE, 1012 Columbia avenue, Philadelphia, exhibited his new water closet pull designed to avoid the usual chain pull being exposed. It provides for the chain or wire to be placed behind the plaster or wainscoting.

MANY VISITORS secured one of the hand books of the Master Builders' Exchange of Philadelphia for future reference, as it gave the Philadelphia building law and the plumbing and house drainage laws. The advantages of the builders' exchange and their uniform contract is given. Half tone engravings show the trade school departments, and a description of the exhibits at the permanent exhibition makes the book interesting to tradesmen. Copies can be secured on writing to the Master Builders' Exchange, at Philadelphia.

S. J. PUTNAM, Prince's Bay, Staten Island, N. Y., distributed engravings of the Niagara ejector, a urinal spray adapted for either lead or iron pipe and easily attached.

GEO. HOWELLS of McCambridge & Co., Philadelphia, was one of the most courteous and genial tradesmen who visited the convention. Their line of sanitary plumbing supplies is complete, and includes the handsomest lavatories, baths and water closets. Their special ship water closet is used on the new American line steamers St. Louis and St. Paul.

LEWIS W. GOULD, Vineland, N. J., was an interested visitor at the Convention.

DOYLE BROS., 62 North Clark street, Chicago, distributed literature of their closet repair connections.

WM. BUSS of Buess & Co., 319 East Ninth street, New York, dealers in plumber's marble and slate goods, was the knight who

attended the ladies from New York while the conventions were in session.

GEO. A. KILEY, Hazleton, Pa., was one of the delegates who constructs electrical work as well as plumbing and heating systems.

OLIVER SCHLEMMER, 1811 Linn street, Cincinnati, Ohio, distributed circulars and showed the O. S. distributing fitting for hot water heating. Placed on a riser this tee, by means of a partition, insures a radiator on the lower floor being heated without the several joints to make tight and nipples and fittings now necessary.

THE W. H. PAGE BOILER COMPANY, Norwich, Conn., was represented by W. H. Page, Alexander Don and W. D. Clark and the Volunteer and All Right steam and hot water boilers were by no means the only subjects of their discussion.

E. A. HIBBS, Philadelphia, was represented by Samuel Hibbs, who presented their business card relating to range boilers of all sizes, styles and special high pressure boilers.

THE ADAMS RADIATOR COMPANY, Reading, Pa., was represented by W. H. Clark, who showed a photograph of a new radiator that was pronounced handsome by all who saw it.

W. E. MORGAN and D. W. HOTCHKISS, representing the E. S. Wheeler Company, New Haven, knew every New England plumber.

FRANK STRATTON, Columbus, Ohio, was a delegate to both conventions.

RICHARD H. MAGUIRE, New York, and F. E. McGUBBEN, Washington, did the honors for the Henry McShane Mfg. Company, Baltimore, Md.

Was there ever a convention where a plumbers' badge carried such a commercial value as at the Philadelphia convention?

A FAIRBANKS SCALE in the corridor of the parlor floor enabled delegates to keep track of their avoirdupois, and was liberally patronized.

THE OFFICIAL BOOK of the Brooklyn Master Plumbers' Association was distributed to the delegates. It was bound as a pocket book, in a leather cover, with a list of the officers and members of the city departments, 30 pages of advertising and a ledgerized memoranda with 50 blank pages and a pocket for loose papers.

JOHN MITCHELL made many friends by his prompt and fair decisions and correct disposition of all matters submitted. In the opinion of the delegates Mr. Mitchell made an excellent presiding officer, and his administration has been a success.

CHAS. I. HOBKIRK gave a friendly greeting to the delegates, and his card bore the address of the Delamater Iron Works, New York, and their line of hot air pumping engines.

THE RHODE ISLAND PLUMBERS presented a unique handbook to the delegates containing a list of members and other interesting matter. It was bound neatly in morocco.

AL. T. BOOTH and JAMES G. SCOTT did the honors among the delegates for the new plumbing supply house, the Newell-Booth Company, Philadelphia.

THOMAS SAVILL and M. E. MURDOCK distributed circulars of closet repair connections and the Savill patent coupling for Savill, Wells & Co., Philadelphia.

C. SULLIVAN of Newark went to the rostrum and spoke his piece and carried his end. He will be sent as a delegate next year.

JAMES MUIR of New York was accorded a cordial greeting by the entire delegation.

L. B. CROSS, as usual, was in demand for reading papers and was rewarded for his labor by being accorded the honor of reading a poem by H. B. Middlebrook.

MRS. G. WALLACE SMITH of Philadelphia, in appreciation of her efforts to entertain the visitors, was presented with a handsome memento by a committee from the ladies from New York. The committee were Mrs. John Yule, Mrs. A. Cameron, Mrs. McDowell, Mrs. Wm. Montgomery, Mrs. Place and Mrs. Buess. The gift was a handsome glass basket ornamented with a design in relief decorated in gilt. This was supported by a pretty silver rest.

THE WALLACE PLUMBING SUPPLY & SPECIALTY COMPANY of Philadelphia extended a greeting to the delegates, the honors being done by Frank Wallace.

GUSTAV H. KOVEN represented Heye, Koven & Co., New York, manufacturers of boilers and expansion tanks.

EDWARD C. MILLER showed miniature fittings of the line made by the Perfection Cleanout Company, Haverhill, Mass., and a full size ell with their new Perfection cleanout, which leaves the inside of the pipe smooth, and which can be attached and removed quickly with a pipe wrench.

B. I. ASHEMAN gave here and there a pointer about the pipe tools and machinery made by the Armstrong Mfg. Co., Bridgeport, Conn., which were well known to many of the plumbers.

W. McK. BARBOUR of the Boston Furnace Company, Boston, Mass., enjoyed a visit to the conventions.

FRANK H. HOFFMAN and FRANK ROURKE represented the Rardolph & Clowes Company, Waterbury, Conn., who make the Brown copper boiler and a line of plumbers' specialties in brass goods.

A PLEASING FEATURE of the convention was the presenting each delegate with a chart of the theater, with the spaces for each delegation printed in colors, so that there was no trouble in getting properly seated without confusion.

THE WISCONSIN PLUMBERS gave out a calf covered reference book, giving the officers and by-laws of their association, the Baltimore resolutions, some miscellaneous recipes, some convenient tables, some list prices, estimate blanks, discount tables and a list of their members.

OWEN & SALTER, Philadelphia, manufacturers of plumbers' goods, were represented by A. G. Heston and Thomas F. Hazelton.

THE WM. PENN silver souvenir spoon and the china soap cup presented to the ladies were examples of artistic workmanship and of exquisite design.

THE LADIES were unanimous in pronouncing the hospitality of Philadelphia as perfect and the entertainment provided as surpassing all efforts of the past. They regret that all the conventions cannot be held at Philadelphia.

ALLEN GAWTHROP, JR., Wilmington, Del., distributed a comprehensive pamphlet of Gawthrop's hydraulic ram that was preserved by many of the delegates for the information it contained.

ALEXANDER S. STEWART did the honors for Tatham & Bros., Philadelphia, manufacturers of lead pipe, sheet lead and pig lead.

FRANK PHILLIPS, Baltimore, second vice-president of the Leibbrandt & McDowell Stove Company, Philadelphia, visited the convention in company with J. B. Borden of F. M. Borden & Bro., Philadelphia.

APPROX OF THE FACT that a convention of the International League of Press Clubs was being held in the Quaker City this week at the same time as the master plumbers' convention, the Philadelphia Record was moved to observe that these were proud days for the lead pencil as well as for the lead pipe interests.

New Jersey State Association.

The plumbers of New Jersey assembled in one of the parlors of the Continental Hotel on Wednesday morning to form a State Association at the call of the State Vice-President John Hickman. Those present were the National officers, John Mitchell and H. J. Pattison and W. J. McDermott, president of the New York State Association of Master Plumbers.

C. E. Schmidt of the Carrie Hardware Company, Atlantic City.

J. J. Kiehl, W. J. Cross, Edward Moore, Chas. H. Shelk, J. S. MacDonald, F. T. Kelaher, C. T. Miller, and J. Blackshaw, Jersey City.

Thomas Bazley, Long Branch.

C. Sullivan, W. Zelfiff, N. J. Steiner, F. J. Sturn, C. O. Rourke, Elias Berla, B. Berla and M. Bleything, Newark.

John Flitcroft, Ocean Grove.

James T. McNab, B. J. Roegiers, Chas. Walls, John Hickman, R. Beaumont, James Kearney, Paterson.

Mr. Hickman opened the meeting with a short, crisp address, recounting his work for the past year, setting forth the beneficial results of the local associations formed and urging the formation of a State organization. On motion of W. Zelfiff Mr. Hickman was made chairman. He announced the first business would be the election of officers and the following were elected: President, Elias Berla.

Vice president, Edward Moore.

Secretary, J. T. McNab.

Financial secretary, J. S. Flitcroft.

Secretary, J. J. Kiehl.

Mr. Hickman invited the new president to the chair, and Mr. Berla made a brief address, advising the delegates to report their action of forming a State association to their local associations and to secure their approval. C. Sullivan moved that a committee be appointed to draft resolutions to thank State Vice President Hickman for his good work, and President Berla invited National President Mitchell to appoint the committee, which he chose as follows:

C. Sullivan, E. Moore, A. Don and Elias Berla.

C. Sullivan was then elected to be recommended to the National Association for State vice-president.

On invitation W. J. McDermott of New York made some suggestions to the new association to aid it in its work. F. J. Sturn, on behalf of the Master Plumbers' Association of Newark, N. J., invited all present and the plumbers of the State to join them in celebrating their annual Plumbers' Day, on Saturday, July 27, in a clam-bake at Pleasure Bay, N. J. The meeting adjourned to meet on the boat to Lincoln Park in the afternoon excursion, to transact further business.

The New Jersey State Association met at Lincoln Park and arranged some special business and adjourned after issuing a call for a meeting at Newark, at the headquarters of Newark Association on Market street, on June 28. Each local association is entitled to be represented by its presiding officer and one delegate.

Excursion on the Delaware.

The delegates and their lady friends assembled at the Race street wharf at 2.15 Wednesday afternoon as guests of the Philadelphia master plumbers and embarked on the steamer "Chauncey Vibbard." A short sail up river brought the party abreast of Cramp's shipyard, where a turn was made and ample time allowed for an inspection of the yard and a view of the immense vessels in course of completion. The stately liner "St. Paul," sister ship to the "St. Louis," of course claimed a good deal of attention, although the war ships were objects of unconcealed interest. Proceeding, the vessel stemmed down river about 12 miles until Lincoln Park was reached. The various objects of interest along the river were pointed out to the visitors and the short journey was much enjoyed. Arrived at the park the company participated in the pleasures afforded by the resort, and at 6 o'clock repaired to the pavilion, where an excellent dinner was provided and a couple of hours pleasantly spent. About 8.30 a programme of fireworks was commenced, this feature of the entertainment lasting about half an hour. The display concluded with a set piece embodying the familiar seal of the National Association. The illumination of the grounds was particularly fine, the initials N.A.M.P. forming the basis of many of the designs. The company re-embarked on the steamer for the return trip at 10 o'clock, and after a pleasant sail reached the city, all much impressed with the trip and the hospitality of their hosts. The company was considerably augmented by the addition of the members of the Philadelphia Association and their friends, and the estimated number of those taking the trip was 1500. There was no hitch in the arrangements, and everything at the resort in the way of amusements and refreshments was placed at the disposal of the guests.

The Souvenirs and Trolley Ride.

The ladies on the carriage ride were presented with a handsome after dinner coffee spoon. The handle was a figure of Wm. Penn, with the word Philadelphia across the stem and the date 1895 in the bowl. The spoons came from the well-known Philadelphia silversmiths, J. E. Caldwell & Co., and were said by the ladies to be simply beautiful. On Thursday afternoon a "trolley ride" through the beautiful suburbs of Philadelphia was taken, the ride in-

cluding Jenkintown, Willow Grove, Chestnut Hill, and the celebrated and historical Germantown district with its attractive scenery and handsome residences. This was the occasion for presenting the fair guests with a souvenir hanging soap dish and brush holder made of non-crazable vitreous china, by the Keystone Pottery Company, makers of sanitary earthenware, at Trenton, N. J. The piece of fine china was handsomely decorated after the Limoge style with blue and gilt, and again the Philadelphia hospitality called forth the unlimited praises of the gentle sojourners.

All the delegates and ladies were presented with a souvenir book of Philadelphia. The book was handsomely bound in a maroon silk cover bearing the seal of the Philadelphia Association in embossed gilt and the words, "Souvenir, National Association of Master Plumbers, Philadelphia, 1895." The book was profusely illustrated with fine half-tone engravings, showing the principal buildings and scenes in the city and Fairmount Park. It contained a list of the officers and of the members of the Philadelphia association and their by-laws. A brief description of social, educational and commercial institutions is given, with crisp reviews of its club life and amusements and sports. The alternate advertisements of the plumbing goods manufacturers and supply houses throughout the country who had lent their hand in assisting the local association to extend a splendid hospitality.

Ladies' Reception and Entertainments.

A pleasing feature of the convention was a reception at the Continental Hotel by the ladies of Philadelphia to the visiting ladies, and the hospitality dispensed plainly showed the guests that their sojourn would be informal and pleasant. A book of fire parchment paper, handsomely bound in white seal leather, was presented to each lady, and on giving her autograph she was presented with a souvenir programme of the entertainments provided, a souvenir book of Philadelphia and an invitation to a carriage ride through Fairmount Park on Tuesday afternoon.

Among the ladies present were Mrs. John Trainor, Mrs. J. F. P. Carey, Mrs. Henry Ewinger, Mrs. P. H. Callahan, Mrs. J. Quinn, Misses Lyous, Mrs. P. M. Murphy, Mrs. P. Sanders, Mrs. Paul Redieser, Mrs. Charles C. Breyer, Mrs. Chas. J. Herbert, Mrs. Robert Griffith, Mrs. Thomas Conway, Mrs. Chas. F. Byrne, Mrs. J. J. Wade, Mrs. T. P. Culleton, Mrs. John Roland, Mrs. James Deveney, Mrs. John M. Simpson, Mrs. W. W. Murphy, Mrs. C. W. O'Neill, Mrs. P. H. Murphy, Mrs. H. Raymond, Mrs. Geo. B. McCall, Mrs. T. R. DeLace, Mrs. A. H. Brown, Mrs. John Mitchell, Mrs. H. J. Pattison, Mrs. T. J. Tute, Mrs. Geo. Carmichael, Mrs. J. J. Lawler, Miss Annie Sheap, Mrs. O. B. Fuller, Mrs. Phil C. Ring, Mrs. Chris Branch, Mrs. John O'Brien, Miss May Trainor, Mrs. J. F. Trainor, Mrs. J. H. Castler, Mrs. H. J. Kueper, Mrs. J. S. Stygall, Mrs. F. H. Suhe, Mrs. J. C. Courroy, Miss E. A. Donahue, Miss Kirk, Mrs. Daniel Russell, Mrs. J. S. Fuller, Mrs. F. G. Lees, Mrs. John M. Page, Mrs. H. B. Middlebrook, Mrs. James Ahern, Mrs. P. J. Kane, Mrs. E. J. Loneragan, Mrs. E. J. Nolan, Mrs. Kramer and Miss Kramer.

On returning from the carriage ride the ladies visited the evening session of the convention, and later the United States Marine Band gave a concert.

What are the Abuses that Have Developed in a Master Plumbers' Association? What is the Remedy?*

BY JEREMIAH SHEEHAN, ST. LOUIS.

In selecting one of the six subjects suggested by the National Essay Committee I have chosen one which is to my mind the most important for the association properly conducted without abuses depends the accomplishment of all our objects. It is the only solid foundation upon which we can lay with safety all our hopes for the accomplishment of our laudable undertaking.

*What are the Abuses that Have Developed in a Master Plumbers' Association? What is the Remedy?**

The only real abuse that I know of as existing is the abuse which the presiding officer receives from his friends on the floor when he rules them out of order. There is friendly rivalry in ranks. There are two or more parties in all associations, as there are in political organizations, each striving for ascendancy. Sometimes there is intemperate rivalry for office and the honor of representing the association at national conventions, and which, perchance, causes a little temporary hard feeling. Surely this is not one of the alleged abuses. There is not a better evidence of the life and progress of an association than to see 150 members out of a membership of 100 present at an election of local officers and delegates to the convention. Show me an association with a larger attendance at meetings and rivalry for the honors and I will show you an association which accords protection to its members, for there are many details necessary for local protection that must be attended to by the local association in order the receive the full benefit of affiliation with the National Association. We need the strong arm of the national to help us, and never before was this more evident than to day.

LACK OF ASSOCIATION INTEREST.

What might, perhaps, be called a common abuse is the lack of interest evinced in the affairs of the association on the part of those who should be foremost in promoting legitimate reforms, in preserving self interest and encouraging and assisting officers in carrying out the resolutions of the organization. But this can hardly be called an abuse, nor attributed to the growth of organization, for it existed prior to the formation of the association.

We will take up the latter question of the subject. It will be admitted that the trade has attained a greater measure of success than the most sanguine at first anticipated possible, and that there are no abuses except from the pessimist's standpoint, and that the undesirable elements of membership are all organizations with unhealthy and dissatisfying principles, which depress the buoyant spirits of those who look upon the bright side of life. What is the remedy? Or, more relevant to existing conditions, what can be done toward removing all regarding obstacles and to consummate more complete and uniform protection and elevation of the craft and its followers? We have made much advance along the line of protection, and equal advance in promulgating the salutary principles of our trade. The permanency of the National Association is assured and its influence recognized and felt. I think that now more attention should be given to improving the grade of work. This can only be done by a permanent suspension of the outrageous cutthroat competition so prevalent everywhere.

AN HONEST JOB.

Our motto should be, "An Honest Job." There is work for all, and there would be more work if more care were taken with what is done. The builders of all our best houses are willing to pay well for good work, but you cannot blame them if they want to get a \$1500 job done for \$1200 or less. Many of us are not experts when it comes to buying a suit of clothes, but the most shrewd will ponder when two suits, apparently the same, are offered, say, one for \$35 and the other for \$45. If the suits are of the same quality and workmanship you may be sure one tailor employs a cheap class of help, while the other is willing to be seen will not shrink the cloth and neglect

many of the minor details necessary for the make-up of a first-class suit, and the other employs first class workmen, shrinks the cloth before cutting, and takes care that the seams are all strong and durable. Some of the material is as good as the money calls for. We all know the first class of tailors and generally avoid them; they generally shift from one city to another; they do not see the error of their way until it is too late; while we laugh at their foolish methods they are poking fun at the plumber. Somewhere I have read, "If we could see ourselves as other people see us," what a wholesale crashing of mirrors there would be. There is not a class of mechanical tradesmen that requires so much hard training to become competent as the master plumbers, and there is not a class as a whole, that receives as little remuneration and as much undeserved abuse. How many plumbers are there like the first tailor, so anxious for work that they will have it at any price, and trust to luck in substituting a less expensive bowl, an inferior grade of pipe and a little lighter, and the customer is helped to do the work, and if this falls stand off the supply houses. Like the first tailor, this class of plumbers is never well off enough to wear the diamonds we are accused of possessing.

First we will have to acknowledge our faults, not abuses, which are the cause of our disfavor and an apparent disregard of the duty we owe to ourselves and posterity, which in many cases will take up the work where we have left off.

FOUNDATION PRINCIPLES.

As already stated, the association is a foundation and the success of an organization is dependent upon the governing principle. For centuries associations of all trades and callings have existed, and their success has depended on the controlling principles and acts of members. Harmonious organization, an active unanimity of purpose, not individualism and inimical relations, are necessary for success. Many associations have been formed on the inspiration of the moment, perhaps as the direct result of acts of workmen or on the convincing and pleasing utterances of a national organizer. They have started out with all the enthusiasm possible, but have failed in a few months, simply because the foundation was not properly laid. Radical measures may have been adopted which were impossible of execution, and failure caused disruption. In other cases nothing particular was attempted. They organized simply because they thought they should, and, having no definite line of action to pursue, drifted into inconspicuous desuetude.

In the construction of a building great care is taken at the foundation. The larger the structure the more care exercised. The master plumbers' organization is universally acknowledged to be the best trade organization in existence, so we must carefully look to the foundation. The various Provinces have considered our motives as honorable and worthy of emulation, and only recently held a meeting in Montreal with a view of attending our national convention in Philadelphia, and with the hope that provision would be made for their affiliation with us.

LOCAL PROTECTION.

Within the jurisdiction of the National Association the St. Louis Association was the first to formulate and successfully carry out a line of more complete local protection than provided in the Baltimore resolutions. In furthering our local interest the national protective resolutions were lost sight of, as has been done in other cities. I have been informed that the largest association in the national organization could not produce a half-dozen signatures to the Baltimore resolutions. The resolutions were alleged to have been signed, but no proof was on hand. However, it is pleasing to note that President Mitchell has secured over 250 signatures to the resolutions during the past six months. It is unnecessary to review our glorious past as a "banner" association. Associations are formed for the purpose of giving strength and obtaining by individual effort. United we stand and divided we fall" tersely expresses the principles on which we have depended and which have given us our prestige, and on which both local and national associations must depend for future success, whether it be in suggesting arrangements with the supply companies which will make their associations beneficial to ours, or influencing State and municipal legislation in the interest of sanitary plumbing or refusing to give esti-

mates to sub-contractors. In ascertaining the strength of a piece of timber the weakest point measures its power, and to a very great extent this rule will apply to the association's power for good. A casting aside of all local differences, whether it be in local, State or national associations, is essential. Our future efforts demand more united action to preserve and extend the objects for which we are organized.

TRAPS AND VENTS.

THE NEW CHICAGO PLUMBERS' SUPPLY HOUSE recently referred to is now in running order. It is located at 45 Franklin street. The style of the firm is Western Plumbing Supply Company, and S. E. Young is manager. Mr. Young was connected with the widely known Chicago plumber, E. Baggot, for 23 years, so that he evidently should know just what plumbing is all about. He also enjoys an extended acquaintance with the trade, which is another excellent qualification. Further, he is brimful of enterprise and believes in giving personal attention to all details. The firm have started in a modest way, having a store room only 20 x 60 feet, but it has a 16-foot ceiling, which enables it to be made practically a two-story store. The bins for carrying stocks extend from floor to ceiling, with a half floor at mid-height to reach the upper tiers. Thus almost every inch of room is utilized, enabling a good stock to be carried. Heavy goods are stored in the basement under this store and also under the adjoining building at 43. A jobbing business will be done exclusively; no special manufacturer being represented. Staple goods will be handled, covering everything that a plumber needs. At present the firm will pay special attention to city trade, having no traveling men out to canvass other territory. They are already doing an excellent business.

L. J. CULLEN, Appleton, Wis., and J. Baile of Chicago, are about to open a plumbing shop in South Kankana, Wis.

WILSON & LAWSON, two young plumbers of Pueblo, have opened a plumbing shop at Florence, Col.

AMSBURY & BROWN of Penn Yan, N. Y., have sold their plumbing business to J. C. Shannon & Son.

THE RACINE PLUMBING & HEATING COMPANY, Racine, Wis., have filed articles of incorporation. The capital stock is \$5000 and the incorporators are C. B. Hulett, A. E. Hay and John Wahlen.

Michael J. Manion.

At a meeting of the Toledo, Ohio, Master Plumbers' Association, held June 5, the following resolutions were unanimously adopted on the death of Michael J. Manion of the firm of Manion Brothers, Toledo, who was drowned near St. Ignace, June 2:

Whereas, It has pleased our Heavenly Father to remove from this earth our beloved companion and fellow member, M. J. Manion; and

Whereas, In all our intercourse as master plumbers and business associates he has ever proved active, energetic and reliable, therefore be it

Resolved, That we tender to his family and friends our deepest sympathy in this the hour of their affliction, and offer our services in any manner as desired.

Resolved, That these resolutions be spread upon the records of the association and that copies be furnished the family of our deceased member and the city papers for publication.

JOHN A. WAITE,
WM. G. WACKER,
JOHN TUTING.

* Presented by the St. Louis delegation at the Thirtieth Annual Convention of the National Association of Master Plumbers, held in Philadelphia, June 11-13.

STEAM AND HOT WATER.

Convention of Master Fitters.

The Master Steam and Hot Water Fitters' Association of the United States began its seventh annual convention in a hall of the Continental Hotel, Philadelphia, on Thursday morning, June 13.

The attendance at the opening session was small, owing to the fact that the National Association of Master Plumbers, of which body many of the Master Fitters are members, held its most important sessions the same day.

THURSDAY MORNING.

The first session of the convention commenced at 11 o'clock, President H. D. Crane of Cincinnati occupying the chair. Motions having been made and carried dispensing with roll call and the reading of the minutes, the president, on motion, appointed the following Credentials Committee:

A. E. Kenrick, Boston.
E. D. Smith, New York.
W. P. Thompson, Philadelphia.
J. B. Hughes, St. Louis.
E. M. Bosley, St. Louis.

The chairman announced that A. B. Jenkins of Jenkins Bros., New York, had very kindly presented a supply of handsome and appropriate badges to be worn by the delegates to the convention. The badges were turned over to the Committee on Credentials for distribution and a committee was appointed to draft a resolution embodying the thanks of the association to Mr. Jenkins for his gift.

The convention then adjourned until 2 p.m.

THURSDAY AFTERNOON.

The meeting was not called to order until 3.35 o'clock. John Traizor of Baltimore, in a neat speech, on behalf of H. B. Middlebrook of Bridgeport, Conn., presented to the association a handsomely framed steel engraving, "Watt's First Experiment," showing the Watt family at supper, and young Watt experimenting with a tea kettle. President Crane accepted the gift in suitable terms and stated that the same would find a place on the walls of the association's headquarters.

On motion of Samuel I. Pope a committee of three was appointed to convey the thanks of the association to the donor of the gift.

The Committee on Credentials then made their report showing 74 members present, having 88 proxies, as follows:

List of Delegates.

ALBANY.

P. J. Sweney.

BUFFALO.

Barnd & Geoger, by Chas. Geiger; John W. Danforth, proxy for Niagara Furnace Company, Wittett, Barrett & Co., J. H. Ruckel & Co., Wm. A. Case & Co., Burgmeister & Co.

ILLINOIS STATE ASSOCIATION.

Robt. Loudon, John G. Roland, P. J. Kane, John W. Mills, proxy for R. J. Ryan, Carson & Co., A. Zwiebel & Co., L. W. Stran, C. G. Smith, J. D. Appleford & Son, Nixon & Crossman, Zeigler Bros., Smith & Moore, G. W. Jameson & Son, Zack & Lymins, Lake & Walters, J. R. Ruddy, H. Marshall, J. R. Blatchford, Doval & Morgan, Morrison & Taylor, John O'Neill & Sons, Chas. W. O'Neill, Wm. W. Murphy.

CHICAGO.

Samuel I. Pope, John W. Mills, Wells-Newton Quay Company, by D. M. Quay; D. N. Quay, proxy for John Woodman, Baker & Smith Company, F. W. Lamb Company, Kehm Bros. & Co., Lyon & Mason, Englehart & Stott Company, John Davis Company, L. N. Prentice Company, Illinois Heating Company, M. J. Cragin, Kroeschell Bros. & Co.; John W. Mills, proxy for Cook & Chick.

CINCINNATI.

H. B. Crane estate, by Harrie D. Crane.

DAYTON, IOWA.

Davenport Steam Heating Company, for G. T. Ahrens; G. T. Ahrens, proxy for Robt. Clayton, Corey & Wernette, P. W. DeHart & Co., G. A. Lister.

DES MOINES, IOWA.

Wallace & McNamara, by J. M. Linnane; J. M. Linnane, proxy for E. Candyke, Asher Heating & Plumbing Company, John Collins, Homer B. Collins, John Burnside.

MINNEAPOLIS, MINN.

Tunstad & Moore, by Jas. W. Moore; Jas. W. Moore, proxy for Kelly & Lamb.

NEWARK, N. J.

J. B. Cryer & Co., by T. B. Cryer.

NEW YORK CITY.

E. Rutzler, proxy for John Neal's Sons; Baker, Smith & Co., by E. D. Smith; Wells & Newton Company, by J. L. Wells. J. L. Wells, proxy for Wm. J. Baldwin, Trask & Carmichael, Evans, Almiral & Co., John D. Clark, by Chas. J. Gillis; Gillis & Geoghegan, by Chas. J. Gillis; James Curran Mfg. Company, by James Curran; H. B. Smith Company, by A. Mercer.

RHODE ISLAND STATE ASSOCIATION.

Phillips & Phillips, by Thomas L. Phillips; F. Coggeshall, by Dan. J. Hersey; H. B. Smith Company, by Jas. W. Smith; Henry T. Root & Son, by Hiram F. Root; Pawtucket Steam & G. P. Company, by J. E. Andrews.

ROCK ISLAND AND MOLINE LOCAL.

Davis Company, Rock Island, by T. B. Davis; Davis Company, Moline, by

T. B. Davis; T. B. Davis proxy for Allen Myers & Co., Blake & Murphy, Rosenfeld Bros., Slattery & Lamp, M. Yerbury, Dan'l Hartwell, H. W. Plambeck & Co. and James Hewson.

ST. LOUIS LOCAL.

John O'Brien, John Ramming, Ring & Reardon, by P. C. Ring; Ringen Stove Company, by Chris. Sodeman; Branch Steam Heating Company, by Chris. Branch; Globe Steam Heating Company, by E. M. Booley; Hughes & Stone, by John B. Hughes; American Heating Company, by O. B. Fuller; Breslin-Sheble Company (Mfg. Co.), by E. A. Sheble; Missouri Steam Heating Company, by H. Z. Sweney; H. Z. Sweney, proxy for Wells-Newton Quay Company and Doherty Bros.

ST. PAUL LOCAL ASSOCIATION.

Roberts-Goss Company, per J. D. Roberts; J. D. Roberts proxy for George R. Martin, McDonough & Bowers, Geo. M. McGeary, Thomas Davis, J. P. Adamson, McQuillan Bros., A. O. Nepil, Allen Black.

PENNSYLVANIA STATE ASSOCIATION.

Baker, Smith & Co., by E. D. Smith; Thompson Bros., by Wm. P. Thompson; Jno. C. F. Trachael, John P. Smith, Reeves & West, Jno. P. Steele Iron Company, by G. P. Steele; P. Gornley, Rand & Conderman, Onderdonk Heating & Ventilating Company, by Chas. S. Onderdonk; H. A. R. Dietrich, W. S. Gernsey, Jno. H. Waters & Bro., W. O. Holmes, W. H. Clarke, B. G. Carpenter, Geo. A. Kiley, Lewis T. Rodan, N. A. Drummheller, Jno. P. Smith, Wm. Morgan, Jno. P. Schaffer.

MASSACHUSETTS STATE ASSOCIATION.

Albert B. Franklin, Walworth Construction Company, by Arthur C. Walworth; Ingall & Kendrick, by P. H. Kendrick; Thayer Heater Company, by John C. Hunneman; Kenrick Bros., by A. E. Kenrick; Daniel Russell; Buerkell & Co., by J. F. Buerkell.

OHIO STATE.

Borger Bros. & Co., by Frank Stratton; Frank Stratton, proxy for Caleb & Contem, John Kearney & Co., W. H. McLain Company, J. J. Smith Plumbing and Heating Company, Sunkel & Heckman, Whyler & Ronseert, Brohl & Appel, Leonard Bros., H. P. Cahill & Co., Theobald & Co., Novelty Machine Works and Oby & Co.

DAYTON LOCAL.

Frank Stratton, proxy for Brooks & Son, Crowley & Stewart, Fauver & Congdon, M. J. Gibbons, McDirmont & Clement, Ware & Moodie.

CONNECTICUT STATE ASSOCIATION.

John M. Page, O'Neill Heating & Plumbing Company, Lincoln, Neb.; W. S. Patterson & Co., Appleton, Wis.; David Ahern & Son, Fond Du Lac, Wis. (by W. S. Patterson, proxy); John Rowe & Co., Omaha, Neb.; Jas. W. Gifford & Co., Elmira, N. Y.; O. H. Gridley & Co., Elmira, N. Y. (by Jno. S. Sadler); John E. McCall, Chippewa Falls, Wis.

A. E. Kenrick said that the Committee on Credentials recommended that W. F. McEntire, secretary of the St. Louis Association, and a lawyer, be al-

lowed to take the floor as a representative of his association. On motion, the recommendation was adopted.

The committee was, by motion, continued.

The badges presented by Mr. Jenkins were then distributed to the delegates. The badges took the form of a button of oxidized silver, with a maltese cross in the center, and the legend "He who helps me, I help" within a circle. President Crane then read his report, which is in part as follows:

President's Address.

The address of President Crane was in part as follows:

It is with pleasure that I welcome you to this our seventh annual meeting. You have come here together from all parts of the country to legislate for the common weal of not only yourselves but of the great body of the master fitters of the United States. I trust that firmness tempered by deliberation and zeal controlled by moderation may so govern our actions that success will crown our efforts. This is, indeed, the most crucial period in our life as an association. We will be called upon at this meeting to face problems and establish policies of more importance to our organization and business than have ever before been presented for our consideration. Questions will be submitted for discussion for which we have no precedent to guide us, no example to follow. We must hew out a new road through an unbroken forest, and we must so blaze the way that it can be followed at all times with certainty and safety by those who come after us. Since we last met in convention together the economic laws of our association have been so materially changed as to virtually amount to a trade revolution. With what success the campaign has been conducted thus far is patent to all, but the time has now come when your leaders, chosen a year since, must return to you the trust in them confided, and the future is in your hands and in your hands alone.

This, as I understand it, is to be a business convention and nothing else; therefore I will not take up your time with useless platitudes but will, as briefly as the importance of the occasion permits, review the events of the past year, making such recommendations as I consider it my duty to present, which you will please understand, fellow members, is but the humble opinion of one man, and submitted from a deep conviction of the responsibility of the position to which your franchises have raised me. The first question to which I wish to call your attention is that of

NATIONAL HEADQUARTERS.

If you will remember, at the last convention the committee to whom the subject was referred selected New York as the location for our permanent headquarters, subject to the action of future conventions. This, in my opinion, was a judicious choice, and should be endorsed by this meeting; for I do not believe it is good business judgment to shift our central office as an Arab moves his tents. In the first place, there is the expense, the time lost and the wear and tear which must ever attend such changes of base; then, as we grow older, we become more conservative, and a permanency of location always carries with it a sense of stability and of the idea that we have come to stay. Further, while I will concede to no man in my love and admiration for the great and growing West, born and raised as I was, and living as I always have in that section,

I must allow that, at the present, the greater interests involved in our business are in the East, and I cannot forget that had it not been for the firm stand taken by our New York members on our "Trade Resolution" platform we would not be as far advanced in our reform movement as we are to-day.

OUR "OFFICIAL BULLETIN."

For which we have to thank the clear-headed foresight of our National Executive Committee, after our "Trade Resolutions." I consider the most valuable feature which has been inaugurated during the year. Started as it was with a simple monthly typewritten report, it has become an indispensable medium for conveying information to our members and for spreading broadcast over the land the glad tidings of trade protection. It may be that its founders builded better than they knew, but it is certainly a fortuitous circumstance that "Trade Resolutions" and the "Official Bulletin" came into existence about the same time, for certainly, without the latter, the principles inculcated by the former would be known to but hundreds, where they are now almost household words with thousands.

I can see much usefulness in the future for this influential though modest pamphlet, and I trust you will, all of you, give it your most hearty countenance and support.

THE PLAN OF CALLING JOINT CONFERENCES.

Two of which have been held during the year, is a most admirable one, for what can be more proper than, when your Executive Committee are called upon to decide questions which are fraught with great possibilities for weal or woe, that they should be able to consult and advise with those who, having been at the head of national affairs, can bring to their aid that mature judgment which is only to be gained by actual experience, and so essential do I look upon these joint meetings that I would recommend that the Advisory Council be increased so as to include every living past president member of the association, instead of restricting the number to five and retiring one each year, as is the law at present. That there may be some expense attached to this I am well aware, but the advantages to be gained more than counter-balance the expense attendant thereon.

THE UNIFORM CONTRACT.

I am relieved to state, has at last been compiled, and is here for your inspection. No less than 20 of our most experienced members have given their time to this document, and now that we have it, we should use it whenever possible, that the time and money spent in its production may not be wasted, and that it may become, in time, what it is in name—our "Standard Uniform Contract."

THE HOUSE HEATING BOILER QUESTION.

The question of how to induce manufacturers and dealers in house heating boilers to cease selling their wares to the consumers direct has vexed our association for years, but it can, if you will, be settled definitely now and here.

It is absurd to suppose that a master fitter can compete with a house heating boiler manufacturer on a heating contract of moderate proportions, for while, undoubtedly, the manufacturer will sell his boiler to the master fitter at a considerable discount, it is idle to suppose that he will sell it at a net cost to himself, and in this day of close margins the difference in the cost or production price and the figure to the master fitter constitutes a respectable profit on a small job; hence, either the manufacturer must abandon the prac-

tice of quoting figures to the fitter and his prospective customer also, or the fitter must go out of this line of the business and leave the manufacturer in possession of the entire field.

Heretofore our hands have been, in a measure, tied, and all we could do was to humbly ask for justice, being forced to satisfy ourselves with whatever was meted out to us, be it more or less.

But, thanks to our "Trade Resolutions," the remedy is now with ourselves, and so long as there are makers of this class of heaters who are broad enough to look at this question in a just and businesslike light, and honorable enough to live up to their convictions, there should be no difficulty for the committee which will be appointed on this subject to show us the way out of the dilemma.

STANDARD FLANGES.

This is another subject which has been handed down from convention to convention, and which I am also pleased to advise you has been at last disposed of, and a uniform standard schedule of flanges officially and finally adopted.

This standard was arranged after many consultations between master fitters, mechanical engineers and valve manufacturers, so as to meet all requirements, and is believed to be as near perfect as possible.

Several of the most prominent manufacturers have changed their patterns to correspond with the standard schedule, and to be consistent and reimburse them for the expense which, at our request, they have gone to, we should make it a point of business honor to use standard flanges on all our construction work wherever and whenever possible.

I would like to see a resolution passed at this convention to that effect.

THE OSBORNE CASES.

Your Executive Committee informs me that these cases are in a state of "innocuous desuetude," and our attorneys, fully prepared at all points, are awaiting the movements of the prosecution.

This is only another instance of the benefit of a united national organization, for there is no doubt in my mind, had we not presented an unbroken front, we, each of us, would have been assailed piecemeal and have been subjected to untold annoyance and much useless expense, but the mere fact of our concerted action and our combined resistance to unwarranted demands has proven our safeguard and defense.

CANADIAN ASSOCIATIONS.

Those of you who were present at our last convention will remember A. G. Purdy of Toronto, Canada, who favored us with his presence at that time, and from whose remarks we were led to believe that an association similar to our own might be formed over the border, which eventually would assimilate with ours. The instructions and intentions then given and expressed, I understand, have been faithfully carried out by your Executive Committee, and that nothing has come of it is no fault of theirs or ours. We stand in the same position toward our brother master fitters in Canada as our country stands to theirs—ready to meet them half way in all that pertains to a closer business or fraternal alliance, but the initiative rests with them; Mahomet must come to the mountain, for the mountain cannot go to Mahomet.

INCREASE IN MEMBERSHIP.

The last convention having made no provisions for this essential feature other than to elect State vice-presidents, whose duties were but loosely defined, at the request of the Executive Committee I assumed charge of this work.

I entered into correspondence with the State vice-presidents with the view

of ascertaining the feeling of the master fitters in their States as to our association, and the reports from many were anything but assuring, but from the West came an encouraging answer to my letter, and I found our Iowa State vice-president, G. T. Ahrens of Daventry, a man after my own heart. By his thorough and persistent efforts the Iowa State Association was formed, the first to break the ice, and the success of this work decided our Executive Committee to push the rejuvenation of our association upon these lines, the results of which have been gratifying to us all, and of which you have been informed through the "Official Bulletin." Your Executive Committee decided it advisable to send me to the Iowa State convention, held at Burlington, and to St. Paul and Minneapolis, which trip I made during the month of January last, resulting in the reorganization of the St. Paul local and the securing of a scattering membership in Wisconsin, which, before our next convention, will result in the formation of an association in that State, and I also did some preliminary work with our State vice-president, John W. Mills, relative to organizing the State of Illinois, which was subsequently accomplished through the unassisted efforts of Mr. Mills.

I made other short trips to Dayton, Springfield and Columbus, Ohio, and I am pleased to report to you the formation of new locals at Dayton and Columbus, and a State organization for Ohio.

On March 7 State Vice-President F. A. Williams instituted the New York State Association, and on April 9 Arthur C. Walworth, under special commission, formed the Connecticut State Association.

The total increase of membership, embracing New State and local associations and national or unattached members, will be given you in the national secretary's report.

There are many other points which I would like in this address to bring to your notice, but I feel that I must not detain you longer.

Before closing, however, I desire to thank you all for the courteous consideration accorded me during my term of office. Also State Vice-Presidents G. T. Ahrens of Iowa, John W. Mills of Illinois, W. K. Downey of Wisconsin, J. S. Farrell of Indiana, and Messrs. Wells, Walworth, Curran, Thompson and Danforth, and our national treasurer, E. D. Smith, have my heartfelt acknowledgments of the valuable assistance and co-operation they have rendered in the organizing work.

To the past presidents of the Advisory Council I am under obligations for much most-needed counsel and advice, but above all do I wish to own my high appreciation of the yeoman labor performed by our Executive Committee. I have no words at my command adequate to express how deeply we all are in debt to these gentlemen who, assuming the responsibility when our fortunes were at the lowest ebb, have, by their unvaried exertions, unselfish sacrifices and undaunted faith in the future, rallied our demoralized and almost disintegrated hosts, and placed us where the banner of victory is within our grasp.

The report of the Executive Committee was next read by J. L. Wells. We print below extracts from the report:

Report of Executive Committee.

Your Executive Committee in publishing "Bulletins" each month, detailing the work of the month previous, has doubtless kept you in touch with the progress of affairs, and believ-

ing that recommendations as to further legislation should come from your national president, or the body of this convention, rather than from this committee, we will, in as concise a manner as possible, endeavor to give you an epitome of our actions and transactions for the past year.

On June 22, 1894, immediately after the last business session of the New York convention, your committee met at temporary headquarters in the Broadway Central Hotel and proceeded, in accordance with the amended constitution, to elect a chairman of the Executive Committee for the coming year. The election resulted in J. Leland Wells being unanimously chosen for that position.

HEADQUARTERS FOR THE YEAR IN NEW YORK.

That having also been left by the convention to your committee, and New York having been designated as the place, a sub-committee chosen for that purpose selected our present offices at 621 Broadway, which, by special arrangement, we now occupy, pending further legislation in this direction on your part.

ANNUAL SOUVENIR.

Taking into consideration the then business depression of the community, and having in mind the trouble and expense attending the publication of the last official souvenir, the committee concluded to dispense with that feature this year, and decided that the proceedings as published in the July, 1894, issue (convention issue) of the *Master Steam Fitter* of Chicago be adopted as the official proceedings of the 1894 convention.

The various subjects referred by the last convention to this committee and the unfinished business which, by resolution, was also assigned us to complete, demanding, in our opinion, more discussion and deliberation than could be given them at this time, your committee thought best to defer any further present action and adjourned subject to the call of the chairman.

OFFICIAL BULLETIN.

A few weeks subsequent to above adjournment, believing that it would draw the local associations and the individual members in closer touch with each other and the national office, and that you should be kept conversant with the business of the association, it was decided to issue, on or near the first of each month, a "Bulletin" of the previous month's official transactions, and to forward a copy of the same to each of the several locals and to the members of the advisory council and State vice-presidents.

Accordingly, the first "Bulletin" was sent out September 1 to the officers and members as above, and was so distributed for the months of October and November, but the demand from all quarters for this document was so great that on January 1 it was arranged to hereafter issue this paper in printed form, and to publish enough copies to supply the demand. It has since, each month, been presented in the shape with which you are all familiar.

We think this the most important new feature adopted during our administration, and an essential adjunct to our trade reform movement. The cost will be given in the report of our national secretary.

JOINT CONFERENCE OF SEPTEMBER 20.

In accordance with the adjournment of June 22, the first joint conference was called on September 20; President Crane, Messrs. Wells, Walworth, Thompson, Danforth, of the Executive Committee, and Past Presidents Gillis, Franklin and Rutzler, of the Advisory Council, were present.

THE UNIFORM CONTRACT.

A sub-committee on this subject appointed by the national president and chairman of your committee, and presenting different reports signed by the several members, a consensus of them was prepared and forwarded to all members of the Executive Committee and Advisory Council for their judgment and suggestions, to be used for the guidance of the Executive Committee in preparing a standard uniform contract, which would, if possible, be satisfactory to all. This was accordingly done, and at a subsequent meeting of the Executive Committee it was adopted as "standard." Copies of this document are to be had at national headquarters, and are subject to your disposal.

ENTERTAINMENTS AT CONVENTIONS.

Following the lines laid down by the last convention, and after obtaining, as far as possible, the opinions of the membership at large, we addressed a letter to all manufacturers and jobbers who had signed "Trade Resolutions," advising them that we should consider it a favor if the feature of extensive and prominent exhibits at this convention be eliminated, and the plan of collecting subscriptions for the purpose of extending to us social entertainments be abandoned, at the same time offering them the hand of good fellowship and inviting them to be present and join with us in such friendly intercourse as is customary between friends and equals.

It affords us gratification to report that this departure met with widespread commendation, both on the part of our members and the supply trade.

CHANGE OF PLACE FOR HOLDING CONVENTION.

The last convention fixed the place for holding this meeting either at St. Louis or Cincinnati during the month of May, but in view of the fact that we are now working on much the same lines and toward the same end as the National Association of Master Plumbers—i.e., trade regulation—after consultation with the officials of that organization, it was deemed expedient to have the two conventions meet nearly at the same time, and at the same place, in order that duly accredited committees from the two associations could consult together on matters of mutual interest for mutual protection. Your committee, however, not wishing to change the rulings of the convention on such an important question so clearly expressed, decided to lay the subject before the members at large, stating in full the reasons for the change, and to act accordingly. The replies received showed 83 votes for Philadelphia, six for St. Louis, and none for Cincinnati, and it is under this decision that we meet here to-day.

LIST OF MEMBERS.

There having been no official list of our members published since 1893, which, owing to changes, lapses and resignations, was wholly unreliable, your committee, early in the fiscal year, determined to issue a new list, but at that time the uncertain status of our membership and, later, the constant additions being made, owing to the formation of new associations, led us to abandon the idea of a fixed and printed list, and to issue a typewritten one to each member, publishing the additions, and withdrawals, in the "Official Bulletin" each month, which, though a somewhat inconvenient method, we trust has fulfilled the purpose of aiding our members in a due observance of Article XVIII of the constitution, anent visiting bidders.

STATUS OF MANUFACTURERS AND JOBBERS WHO HAVE SIGNED "TRADE RESOLUTIONS."

How we could show our appreciation of the firms who are with us for trade protection was no easy problem. The original intention was that no complaints of alleged violations of the agreements would be entertained or investigated by the Executive Committee unless lodged by a member of the association in good standing; it was urged, and with reason, that those firms who had voluntarily signified their desire and intention to assist us in abolishing trade abuses were entitled to equal standing with our members, and to the same right of investigation and complaint. This was agreed to, and the right of complaint now rests with both buyer and seller alike. This, in connection with that yellow label which has been so unanimously admired, should convince the signers of "Trade Resolutions" that we are in earnest when we say "he who helps me I help." It may be that something more in this direction is needed, but just what it shall be, and how to proceed further, you must decide.

STATUS OF MANUFACTURERS AND JOBBERS WHO ARE ALSO MASTER FITTERS.

In October State Vice-President Mills of Illinois wrote us that in the Chicago local the question had come up whether master fitters who were also manufacturers and jobbers could, under its provisions, sell the consumer direct and be "in accord." Considering this question of much importance the chairman of your committee immediately laid the question before the members of the Executive Committee and Advisory Council, and the opinion of the majority of the joint committee was that inasmuch as it has heretofore been agreed that the possession of a properly equipped shop and being engaged in steam or hot water or wrought iron pipe construction work constituted a master fitter, and inasmuch as master fitters could, under "Trade Resolutions," sell consumers and be "in accord," the manufacturers and jobbers under discussion could sell direct and not be in violation. The joint committee were by no means unanimous in this decision, and it has since occasioned no little comment among our members; however, we have but to report according to the records and facts and leave the subject for the convention to decide.

COMMITTEE MEETINGS.

During the year there have been held at National Headquarters two joint conferences of the Executive Committee and Advisory Council, three meetings of the Executive Committee and one of the Standard Flange and Uniform Contract committees. These were all convened by and with the advice and consent of your national president, and were considered necessary for the good of the association.

The actual traveling expenses of members attending these meetings, being a legitimate charge upon our funds, have been paid by the treasurer.

NATIONAL PRESIDENT "AT HEAD-QUARTERS."

During the month of December National President Crane visited headquarters. He spent some three days acquainting himself with the business methods of the office, and made arrangements to have mailed to him, day by day, copies of the most important letters received or sent out, thus keeping himself thoroughly advised on all association affairs. Having now, as fully as time and circumstances will permit, reported upon all the unfinished business of the last convention, upon all the special instructions given us at

that time, and upon such new matters as have come up during the year, we wish here to thank every one of the officers and members for the cordial support and encouragement extended us during the year; also do we wish to thank our national president and the members of the Advisory Council for the consideration they have given our many and various requests. It affords us unfeigned pleasure to state that they have at all times been in full accord with us, and that all our joint decisions and actions have been singularly unanimous.

We desire to acknowledge the valuable co-operation and courtesy of our national treasurer, not only for his advice and assistance, but also for the prompt manner with which he has at all times responded to our call for funds, without which it would have been impossible to carry on the work laid out for the committee by the last convention.

In resigning the high trust which you confided to us a year ago, allow us to again thank you, each and all, for the courteous consideration which you have ever accorded us. Remembering the many new points we have been called upon to consider and settle, it is a matter of surprise if we have not offended some; if such is the case, we hasten to assure them that it was wholly unintentional, our only object being to conserve the interests of all while protecting the rights of each.

Mr. Wells stated that the Executive Committee would report on other matters in executive session.

Upon motion both reports were received and ordered to be printed.

J. W. Mills moved that a committee be appointed to wait on the National Association of Master Plumbers, then in convention at the Walnut Street Theater, and extend greetings on behalf of the Master Steam and Hot Water Fitters' Association.

The president appointed Chas. J. Gillis and J. W. Mills such committee, and recommended immediate action.

The president then appointed the following committees:

Committee on Trade Relation.

Messrs. Mills, Smith, Curran, Wells, Rutzler, Franklin, Walworth, Buerkel, Thompson, Onderdonk, Gornly, Prentice, Hudson, Simmons, Danforth, Creelman, Rowe, Roberts, Kendrick, Dibble, Sullivan and Borger.

Committee on Constitution and By-Laws.

Messrs. Gillis, Dibble, Hughes and Pope.

Committee on Appeals and Grievances.

Messrs. Ahrens, Sullivan and Doherty.

Committee on Good of the Order.

Messrs. Stratton, Ahrens and Moore.

Committee on Exemptions and House Heating Boiler.

Messrs. Rutzler, Mills and Thompson.

Committee on Official Bulletin.

Messrs. Smith, Walworth and Danforth.

Committee on Uniform Contract.

Messrs. Quay, Franklin and Kendrick.

Committee on Ways and Means.

Messrs. Mills, Williams and Roberts.

Committee on Resolutions.

Messrs. Curran, Mills and Onderdonk.

A. B. Franklin moved that a committee of three be appointed to take up the recommendations made in the president's address, and report at the next session of the convention. The motion was carried, and the president appointed A. B. Franklin, H. Sweeny and W. P. Thompson such committee. Adjournment was then taken until 10 o'clock Friday morning.

FRIDAY MORNING.

By Telegraph.—At 11 o'clock the convention was called to order. The first business was the report of E. D. Smith, treasurer, who made a satisfactory showing of the finances of the association. The amount of cash received from all sources during the year was \$6378, and the expenditures \$5311, leaving a balance in treasury of \$1067 and no outstanding bills. Report received and filed.

D. M. Quay moved a vote of thanks to the officers of the association for their economical and judicious management of the funds. The secretary's report was then read. The report detailed the work of the executive office for the year and gave the number of members in good standing at 349, a large increase over last year. Reports from the vice presidents of State local associations and of unattached members of the National Association, with few exceptions, showed that a good deal of work had been done in the matter of organization and that the condition of affairs in the different districts was very satisfactory. A cable from Nesbitt & Coppings, London, England, was read, conveying the greetings of the firm to the convention assembled and expressing remembrance of last year's hospitality. A cable from A. B. Jenkins was also read announcing his safe arrival in England and expressing his good wishes to all present at the convention. I. L. Wells moved the dispatch of a cable to Mr. Jenkins thanking him for his kindly sentiments and donation of badges. S. I. Pope submitted a resolution for adoption by the convention thanking Mr. and Mrs. Middlebrook for the picture presented to the association. C. Sullivan of New Jersey moved that the convention authorize its incoming Executive Committee to consult with the Executive Committee of the National Association of Master Plumbers for mutual protection in cases where the Baltimore and "Trade Resolutions" have been violated by manufacturers and others who have signed such resolutions. The motion was carried unanimously. The president then appointed the following Committee on Nominations:

J. I. Roberts, St. Paul; A. C. Mercer, New York; H. X. Sweeny, St. Louis; C. S. Onderdonk, Philadelphia; Frank Stratton, Columbus; C. Sullivan, Newark; Samuel I. Pope, Chi-

cago; G. T. Ahrens, Davenport; John Roue, Omaha.

T. B. Cryer of Newark, moved that the Executive Committee be authorized to prepare a suitable certificate of membership, to be furnished yearly to all members in good standing, and the motion was carried. Christopher Branch of St. Louis and C. Sullivan of Newark were added to the Committee on Constitution and By-Laws.

The convention adjourned to meet in the afternoon in executive session.

Pennsylvania Steam Fitters.

A meeting of the steam fitters of Pennsylvania was called to order by State vice-president Wm. P. Thompson in the reading room of the Continental Hotel at noon on Wednesday, for the purpose of effecting a State organization. Harrie D. Crane, president of the Steam and Hot Water Fitters' Association of the United States, and J. L. Wells of the Executive Committee of the national body made addresses on the advantages to be gained for organization, and gave suggestions to aid in the formation of a State association. The meeting then proceeded to the election of officers, when the following were selected:

President, C. S. Onderdonk.

Vice-President, John H. Waters.

Secretary, Harry West.

Treasurer, Wm. P. Thompson.

Among those present were:

H. A. R. Dietrich, Bethlehem.

Geo. F. Steel, Philadelphia.

C. S. Onderdonk, Philadelphia.

P. Gormly, Philadelphia.

N. H. Rand, Philadelphia.

H. W. Nowell, Philadelphia.

J. H. Waters, Johnstown.

W. H. Clark, Reading.

L. T. Rodan, Bristol.

W. S. Germeyer, Carlisle.

Communications signifying that they were in accord were received from the following:

Love Mfg. Company, Corry.

L. Barget, Hanover.

Geo. D. Runk, Clearfield.

H. M. Norton, Easton.

Wm. Kaiser, Wilkes-Barre.

R. B. Vaughn, Kingston.

Cribbs & Hill, DuBois.

Raymond & Campbell Mfg. Co., Middletown.

David R. Burns, Philadelphia.

H. B. Campbell, Middletown.

H. B. Peacock, Easton.

Fred Sackett, Clearfield.

B. C. Floyd, Shamokin.

Gross, Fritzenger & Co., Slatington.

W. A. Heckman, Reading.

W. M. Weitzel, Lititz.

S. W. Barnes & Son, Philadelphia.

D. Bergman, Pittsburgh.

Geo. T. Bailey, La Plume.

Johnson Machine Company, Uniontown.

John Fitz, Hanover.

S. W. Howe, Pittsburgh.

Hempel Bros., Reynoldsville.

Mt. Joy Steam Heating Company, Mt. Joy.

J. B. Sheriff Mfg. Company, Pittsburgh.

John W. Graves, Saltsburg.

Munden & Addy, Allegheny City.

Smith & Walker Hardware Company, Kane.

Streep & Roop, Doylestown.

John W. Addy, Pittsburgh.

Geo. W. Moore, Waynesboro.

J. B. Weiser, Williamsport.
Wm. McCashin, Connellsville.
Gunster & Forsyth, Scranton, Pa.
Sparks & Parker, Pottsville.
Thompson Bros., Philadelphia.
N. F. Drumbeller, Lansford.
John Gormly, Philadelphia.
L. B. Ardrey & Sons, Bristol.
Joseph Leckner, Danville.
W. A. Holmes, Bloomsburg.
Hunt & Connell Company, Scranton.
W. P. Connell & Sons, Scranton.

On motion of Wm. P. Thompson a committee was appointed by the president, consisting of Wm. P. Thompson, P. Gormly and H. W. Nowell, to draft a constitution and by-laws for the association.

After an explanation of the schedule of dues the members' present paid the treasurer and the meeting adjourned to meet again at 1 p.m. Thursday.

A meeting of the Pennsylvania State Association of Steam Fitters was held on Thursday afternoon, and after reading the minutes W. P. Thompson, chairman of the Committee on Constitution, reported that the National Association was making provision to supply a suitable set of State by-laws and in consequence the committee reported progress, after which the meeting adjourned to meet at the call of the president.

Fittings.

JUDSON A. GOODRICH could have been elected to any office in either association by the unanimous vote of delegates, manufacturers and salesmen. He holds the cash box of the American Society of Heating and Ventilating Engineers.

PHOTOGRAPHS of the Niagara radiators were given out by Walter Pendleton of the New York branch of the Niagara Radiator Company, Buffalo, N. Y., with an invitation to call at Parlor 5 and see their new two-column 6-inch wide Niagara radiator and their new pin indirect radiator.

JOHN LEITCH of 206 Centre street, New York, showed photographs of the Standard radiators made by the Standard Radiator Company, Buffalo, N. Y., and greeted many old and new friends.

W. H. HILL, from the New York office of the American Radiator Company, Chicago, arrived on Wednesday and was greeted by the delegates from all sections.

THE GEO. P. STEEL IRON COMPANY, Philadelphia, showed their new steam boiler in their parlor, where the delegates were welcomed by Geo. P. Steel and Canby Steel.

EDWARD L. ROSS represented the Chapman Valve Company, Indian Orchard, Mass., and had a busy time with the delegates.

M. J. HANNA talked the Dunning Club boiler, made by the New York Central Iron Works, with a pleasing effect, to many strangers.

THOMAS B. MASON showed a radiator truck for F. S. Katzenbach & Co., Trenton, N. J. The truck has rubber tired wheels supporting an adjustable cast iron frame, which can be quickly attached to the radiator.

GEORGE E. DOWNE of the Ideal Boiler Company, Chicago, was known to all the delegates and tradesmen.

W. M. MACKAY, New York, represented the Royal line of steam and hot water boilers in his usual style, and was an old acquaintance with most of those in attendance.

ALEX. T. HENDERSON of the United States Heater Company, Detroit, Mich., is a Capitol talker on both steam and hot water heating. Their line of heating apparatus has been satisfactorily tested by many of their patrons.

D. R. McCALLUM of the New York office of the J. H. McLain Company, Canton, Ohio, is a well-known steam and hot water expert to all the Western delegates.

H. H. LINDEMUTH talked the New Sun steam and hot water line of apparatus that is being put on the market by Broomell, Schmidt & Co., York, Pa.

PIPE, FITTINGS AND SUPPLIES, the specialties of McMann & Taylor, New York, were agreeably represented by Frank A. Boose, who has a long acquaintance with the trade.

SECRETARY E. F. GARTZ of the Crane Company, Chicago, was familiarly greeted by the users of steam and water fittings.

C. F. WALTHER of the Niagara Radiator Company, Buffalo, interested the steam fitters in his new radiators.

CAPT. D. PAUL HUGHES of the Standard Radiator Company, Buffalo, N. Y., needed no introducing to the delegates and had a greeting for all. J. B. Hughes of St. Louis is an old friend, and being of the same name claims to be a brother when the sun shines, but no connection whatever in storms.

THE ST. LOUIS RADIATOR COMPANY, St. Louis, were represented by Clark Thoms.

COL. E. N. SQUIRES, secretary of the New York Central Iron Works, Geneva, N. Y., left a lasting impression for the Dunning boilers on the delegates by distributing a souvenir, "Scratch your head and pencil the order for a Dunning," on a neat morocco case containing a convenient comb and a lead pencil.

A NEW CATALOGUE in colors, with a cover design in the Beardsley style of art, was distributed by the New York manager, D. R. McCallum of the J. H. McLain Company, Canton, Ohio. It showed the Humber, Harvard, Cambridge, Amherst, Cornell, Princeton, Yale and Rugby boilers in tinted ink, with the text in colored ink.

THE AMERICAN RADIATOR COMPANY, Chicago, had a parlor where the guests of the convention were received by Treasurer Chas. H. Hodges of Chicago, Major E. R. Pierce of Boston, Frank A. Brastow, Philadelphia, and W. H. Hill, New York, where they invited all to inspect their new Varona radiator on exhibition at their office, 506 Arch street.

O. CHAN. WELLS of the Wells & Coutan Company, Limited, New York, makers of gauges for all purposes, was one of the jolly attendants at the convention, and distributed a *fac-simile* of a steam gauge in cardboard.

A. G. PAUL of the Paul Steam Heating System of Boston found the convention a field for labor.

THE MODEL HEATING COMPANY, Philadelphia, had parlors where A. C. Edgar, M. B. Moore, J. P. Ley, C. W. Sisson, E. E. Barto, Homer Addams, and President A. C. Mott of Philadelphia, W. A. Russell, New York, and J. J. Wilson, Baltimore, distributed gold plated souvenirs representing a section of their boiler.

THE BRISLIN-SHEBLE MFG. COMPANY, St. Louis, Mo., exhibited a combination floor and ceiling plate for pipe fitting, adapted for the use of sheet iron extension tubes.

J. D. STILES of Jenkins Bros., New York, arrived at the Continental on Thursday,

and his fame among the fitters is only second to the fame of the Jenkins valves.

J. P. SCHAFFER, Pittsburgh, and S. C. Smith visited the steam fitters' convention.

THE ST. LOUIS DELEGATION came in a special car carrying Secretary F. McIntire, who chaperoned 12 others.

THE DELAMATER IRON WORKS, New York, distributed catalogues of their hot air pumping engines.

E. M. BOSLEY, St. Louis, circulated sheets illustrating the Incandescent super-heating steam boiler.

THE BEATON & CORBIN MFG. COMPANY, Southington, Conn., distributed Japanese fans bearing cuts of their ceiling and floor plates.

JAMES J. LAWLOR of Lawlor Water Feed & Damper Regulator Company, New York, mingled with the delegates, interesting them in his line.

J. P. SHOOP, Canton, Ohio, was one of the representatives of the H. B. Smith Company, Westfield, Mass., who left Cottage boiler and Union radiator talk out of his conversation.

CHAS. MORRISON had to answer many questions about the new boiler of the Gurney Heater Mfg. Company, Boston, Mass.

THE EATON, COLE & BURNHAM COMPANY, New York, were ably represented by Geo. E. Walton, who was as well known as the valves, tools and fittings made by the house.

THE FULLER & WARREN COMPANY, Troy, N. Y., were represented by David Miller of New York, and many plumbers who use furnaces and boilers greeted him cordially.

JAMES THOMPSON talked range boilers for R. B. Guyan & Co., Philadelphia.

J. D. MURPHY had a word to say for the supply house of John Maneely, Philadelphia.

THOMAS E. CRONE, second vice-president of the American Boiler Company, Chicago, came over from his New York office and aided W. H. Peterson of the Philadelphia office, 28 North Fifth street, in extending greeting to the delegates.

A. WYCKOFF & SON, Elmira, N. Y., exhibited a zinc lined pipe covering for steam pipes that attracted a great deal of attention.

W. S. NEWKIRK, New York, presented a card bearing a cut of the boiler of the United States Heater Company, Detroit, Mich.

GEO. E. BOYLSTON, secretary and treasurer of the Chicago Engineer Supply Company, Chicago, had a busy time with old and new acquaintances.

THE JOHNSON ELECTRIC SERVICE COMPANY, Milwaukee, had a full working exhibition of their system of heat regulation in their parlor and attracted many guests.

E. FOSTER came over from New York and represented the Electric Heat Regulator Company of Minneapolis, making the operation of their system of heat regulation clear to all who were interested.

"ITS A GOOD THING—ADHERE TO IT!"—Surrounding the Jenkins trade-mark was this inscription in gilt on a little leather case filled with court plaster, distributed by J. D. Stiles, the representative of Jenkins Bros., New York, the valve manufacturers.

T. G. HEYWOOD of the Chicago house of the Niagara Radiator Company, Buffalo, N. Y., met a lively reception on his arrival.

HEATING NOTES.

EDWARD P. BATES, Syracuse, N. Y., is prepared to furnish the schedule of standard flanges at a small price. This schedule was prepared by a committee of the American Society of Mechanical Engineers, the Master Steam and Hot Water Fitters' Association and a committee of the leading valve and fittings manufacturers of the United States. It is printed on heavy cardbord 18 x 24 inches, with the diameters, sizes of bolts, number of bolt holes, radius of bolt circle, thickness of flanges and other valuable information. On the reverse side of the card is a full size drawing of flanges to 10 inches in diameter, showing bolt holes, &c.

THE STANDARD RADIATOR COMPANY, Buffalo, N. Y., issue new circulars of their well-known line of radiator goods. The trade will be particularly interested to learn that these goods are now known under the name of the Buffalo Standard. The circulars show the Buffalo Standard single loop, regular loop, four-column, direct-indirect and single column radiators, all for steam or water. The half-tone illustrations are set off by decorative vignettes printed in light color, and with each illustration are given particulars of sizes, &c. The different circulars are printed in various colors, giving a variety of effect.

A EUROPEAN EXCHANGE mentions that a house indifferent to thermal variations has lately been erected at Chamounix, Switzerland. This structure is built on a tubular framework, with a constant circulation of water forming a heat radiator of wide surface during the winter and cold radiator in summer, and at the same time a water conduit.

THE WEBSTER CITY HOT WATER HEATING COMPANY have been incorporated at Algona, Iowa, with a capital stock of \$50,000, to manufacture hot water heating apparatus.

F. W. JAQUI, the heating engineer, represents the Thatcher Furnace Company of 240 Water street, New York, in New York City, Brooklyn, Jersey City and in New York State generally, including Long Island.

A NEW NON-CONDUCTING COVERING for steam pipes has lately been introduced by an English firm—R. M. Morr & Co. of London. The pipes are covered with a fabric made of large reeds laced together into mats, a layer of fossil meal being placed both below and over the reeds. The reeds form an air space in which, it is claimed, there are no connective currents.

A SMALL OBLONG PAMPHLET issued by the Belknap Mfg. Co., Bridgeport, Conn., calls attention to radiator goods, of which they are making specialties. The first article is the Belknap hot water valve, which is illustrated, and its merits are summarized under three general headings, which will be read with interest by those who have use for such goods. The extra heavy Jenkins radiator valves follow, and at the close are illustrations of radiator union elbows and radiator air valves. Full price-lists, tables of sizes, &c., are given. The title to the pamphlet consists of the word "Belknap," the first syllable being represented by a small illustration of the old Liberty Bell.

THE LATEST OF THE CATALOGUES relating to Richmond steam and hot water heaters is that issued in the interest of Isaac Coffin & Co., 52 Sudbury street, Boston, Mass. It is a neat round cornered pamphlet bound in green paper, containing 40 pages, 30 of which are given up to general and sectional illustrations, together with de-

scriptive particulars and tables of prices and sizes, while the rest of the pamphlet gives testimonial letters from many different sources, as well as some four pages of references from Boston and vicinity.

E. N. GATES, manager of the Diamond Boiler Company, Holliston, Mass., is spending two weeks at the company's foundry at Canton, Ohio. Mr. Gates calls on the trade both going and returning, traveling by different routes each way. The boilers of this concern now ready are Nos. 16, 19, 23 and 32, while Nos. 27, 38 and 48 will soon be ready. We understand that they are placing their agencies very satisfactorily.

THE AMERICAN BOILER COMPANY, 94 Centre street, New York, and 84 Lake street, Chicago, are distributing elegantly printed reproductions of the medal received by them at Belgium's World's Fair, Antwerp, 1894, where they were awarded highest honors. The obverse bears a vignette of King Leopold II, the reverse a partial view of Antwerp, over which is the globe, encircled by a band inclosing an olive branch. A copy of the circular is also at hand, which the company have issued addressed to the "gentlemen of the convention." It is an extremely forcible presentation of the claims of the American Boiler Company for the business of those who install house heating apparatus.

A DISPATCH from Chicago announces that the Crane Company of that city, who are among the largest manufacturers of pipe fittings and brass goods, have granted an increase of 10 per cent. in the wages of their 2300 employees.

F. G. WEBBER, representing the Fowler Radiator and Mfg. Company, has established in business at 88 Lake street, Chicago.

THE A. A. GRIFFING IRON COMPANY, Jersey City, N. J., have moved their New York office to the corner of Centre and Worth streets. Here they have taken a large building and have fitted up a handsome showroom.

Association of English Plumbers.

According to the English papers a large and representative meeting of the master plumbers of England was held at the Queen's Hotel, Leeds, May 22.

It resulted in the establishment of the National Association of Master Plumbers. The following officers were elected. President, H. Lightfoot, Manchester; vice-presidents, A. E. Biggs, Leicester; J. Lindley, Sr. Leeds; R. W. Cooke, Newcastle; E. Flewitt, Nottingham; J. B. Corrie, Sheffield; and R. P. Stafford, Halifax; treasurer, W. Jaffrey, Manchester. The purposes of the organization as recorded in the English papers are summed up under the following heads: 1. To raise generally the status of plumbers throughout the country. 2. To take steps to prevent the great bulk of contract work being done at unremunerative prices. 3. To unite in a federation of master plumbers. 4. To mutually protect each other and act in concert for the protection of the trade. 5. To support each other in cases of strikes or labor disputes. 6. To confine plumbers' work to plumbers and prevent merchants and manufacturers from supplying goods direct to the customers. 7. To bring about, if possible, improvements in the system of contracting.

TIN PLATES.

Summer Shut Downs.

Welsh tin plate manufacturers appear to be taking some comfort to their souls from the hope that "a hot summer in the United States will throw the American works out of gear." "Climatically," they urge, "South Wales has great advantages over America in tin plate manufacture." South Wales and Great Britain generally possess a similar "climatic advantage" over America in connection with all lines of iron and steel manufacture. Yet this fact has not served to restrict American production in those lines. Nor do we think that our unfortunate failure in the matter of climate will exercise any very depressing influence on the American tin plate industry. It is likely that a shut down of two or three weeks during the heated term may be necessary. But this is only usual. A brief closing of the works is found advisable in most cases in order to give opportunity for a general overhauling of machinery and the carrying out of small repairs, as well as to give some rest to the workmen. Judging, however, from the crowded condition of the order books in most of the domestic tin plate mills at present, no prolonged shut down will be undertaken this year unless extraordinary heat or other unlooked for cause should make such action imperative. Already some manufacturers have withdrawn quotations and many report their works full with orders until the close of the month of August, and they signify their intention of running right along until that time. The heat of the weather is less likely to cause involuntary shut downs among the American works this summer than is the rise in steel prices and the difficulty, now beginning to be felt, in getting tin plate bars. These causes are the ones which give anxiety to the tin plate makers just now.

SCRAP.

THE CAMBRIDGE CITY PUNCH, SHEAR & ROLL COMPANY, Richmond, Ind., have recently delivered one of their duplex direct acting power shears to the works of the American Tin Plate Company, Elwood, Ind. The Cambridge City Company are now engaged on drawings and patterns for an order of several special machines for the same concern.

THE *Newcastle Chronicle* of Newcastle, England, states that an iron and tin plate factory is to be started at Birtley, in the same district, by the northern co-operative societies. It is not clear whether this announcement means that tin plate mills are to be started or whether merely tin plate factories for the manufacture of tinware are intended, probably the latter.

THE TIN PLATE WORKMEN in the Llanelly tin mills, who some time ago severed their connection with the Tin Plate Union, have now returned to the union fold.

THE ELWOOD BOX FACTORY, Elwood, Ind., which manufactures boxes for the

American Tin Plate Company of that place, has been obliged to work overtime to fill orders, the demand for tin plate boxes being exceedingly large at the present time.

THE MANAGEMENT of the National Tin Plate Works, now being built at Anderson, Ind., have placed an order for two more tin mills in addition to the four mill plant now in course of construction. It is the declared intention of the company to put the entire plant in operation by September 1.

IN DISCUSSING the Canadian tin plate outlook a writer in *The Hardware and Metal Merchant* of Montreal comes to the conclusion that as American iron has driven British iron out of the Dominion the operation is likely to be repeated in the future in the case of tin plate also.

ALL THE COMPANIES making a specialty of the manufacture of tin plate machinery report that a remarkable drive in this line is now being experienced by them.

THE TIN PLATE WORKS of the Laughlin Nail Company, Martin's Ferry, Ohio, were compelled to close down for a short time last week on account of the difficulty of obtaining sufficient steel. This drawback has been experienced by a number of tin plate works recently. It is stated that the inconvenience will shortly be removed by the increased production now taking place among the steel mills.

THE NEW TIN PLATE PLANT of the La Belle Iron Works, Wheeling, W. Va., has been put in operation, the start being as successful as anticipated. It was found necessary to make some slight changes, but these required only a day or two, and the plant is again in full operation. The concern have quite a number of orders on hand. The equipment for this plant was furnished by Leechburg Foundry & Machine Company of Pittsburgh, the erection being under the superintendence of Ambrose Beard.

A DISPATCH from Braddock, Pa., states that the light rail mill of the Edgar Thomson plant at that place, owned and operated by the Carnegie Company, will be rebuilt at once as a tin plate mill. The plant, it is said, will be ready for operation in less than a month.

THE LEECHBURG FOUNDRY & MACHINE COMPANY, Pittsburgh, Pa., have received an order for a Meata pickling machine for the new tin plate plant of the Stickney Iron Company, Baltimore, Md.

WORK is actively progressing on the new buildings for the extension of the tin plate plant of the New Castle Steel & Tin Plate Company, New Castle, Pa. Four large boilers furnished by the Bess Foundry & Machine Company, Fort Wayne, Ind., are now being placed in position.

THE IRONDALE STEEL & IRON COMPANY, Middletown, Ind., have lately started two extra mills in connection with their tin plate plant. The com-

pany's working force has been increased by about 250.

CABLE ADVICES indicate that further strikes are expected in the Welsh tin plate manufacturing districts which are likely to hamper the business of the manufacturers next month.

IN THE INTERESTING SERIES of ARTICLES on "The Tin Plate Industry in the United States," now running in the *London Engineer*, a table of American tin plate works and brands is given in the issue of that journal for May 31. This exhibit is a reproduction of the quarterly list printed in *The Metal Worker* of April 6. The names of three concerns, however, are added, which were not given in our table, namely, the Illinois Steel Company, the New Kensington Tin Plate Company and the Stickney Iron Company, which names, the writer of the article states, were procured from another source. These concerns were not included in our quarterly list for April because the Illinois Steel Company informed us that they were not in the business of tin plate manufacture and had no present intention of embarking therein. Moreover, there is no such concern in existence as the New Kensington Tin Plate Company. Probably this title was intended for the concern known as the Pennsylvania Tin Plate Company, of New Kensington, Pa., which was included in our list. The Stickney Iron Company were not included because at that time they had not actually begun their preparations for manufacturing tin plates.

BRITISH BOARD OF TRADE returns for May show that during the month the total exports of tin and terne plates from Great Britain were 33,000 tons, against 30,000 tons in May, 1894. Of this amount 18,000 tons were sent to the United States, against 21,291 tons in the corresponding month of last year and nearly 16,000 tons in April, 1895. The total shipments of tin and terne plates to this country for the first five months of the year have been 94,500 tons, against 83,000 tons in the same period of last year. The following table shows the total exports of tin plate from Great Britain to the United States for the past five years, in tons of 2240 pounds:

	1895.	1894.	1893.	1892.	1891.
January.....	18,839	18,346	22,498	17,534	32,018
February.....	23,201	13,413	20,190	22,208	28,253
March.....	18,733	16,907	31,334	22,789	28,638
April.....	1,946	33,210	31,651	31,061	45,248
May.....	18,000	21,311	29,983	25,799	55,349
June.....	17,247	29,759	23,550	63,539	
July.....	17,865	22,248	24,750	4,323

Totals	94,516	226,879	255,583	276,479	325,145

PRESIDENT FLORIAN GROSJEAN of Lalance & Grosjean Mfg. Company, 19 Cliff street, New York, has just returned from a trip to Harrisburg, Pa., where preparations are being made for at once starting up the company's black plate mills located at that place, and which have been idle for some months. The new tinning department will also be ready for operation within a short

period. The buildings are completed and the tinning sets and appliances have been received and are now being placed in position. Space is provided for 16 sets, and a beginning will be made, experimentally, with four Elwood pots. The works will give employment to about 300 men.

THE DIFFICULTY recently experienced by many domestic tin plate works in obtaining a prompt and sufficient supply of bars for their purposes seems likely to result in the addition of bar mills to a number of the existing tin plate plants. More than one tin plate manufacturing concern is now understood to be figuring on the cost of building such mills and, in at least two cases, the mills have been contracted for and the work thereon has already commenced. It looks as if, in the up to date American tin plate works of the future, a bar mill will be considered an indispensable adjunct.

THE LA BELLE IRON WORKS, Wheeling, W. Va., have given a contract to the H. S. Sands Electric & Mfg. Company for the installation of a new electric light and power plant in the tin plate works just completed and put in operation by the La Belle Iron Works. There will be one generator to furnish light for 20 arc lights and 200 incandescent lights, a power dynamo for driving motors, one motor for the tin plate mill and one to drive large lathe, also motors for the shears and a large electric travelling crane.

THE BELLAIRE NAIL WORKS COMPANY of Bellaire, Ohio, have commenced the erection of a new tin plate works and large sheet and bar mill, which will cost in the neighborhood of \$300,000.

HEATING AND PLUMBING.

NEW WORK AND CONTRACTS.

THE BID of Gaylord & Eitapence for steam heating and ventilating the City Hospital, Binghamton, N. Y., has been accepted, the price being \$1873. David J. Malone obtained the plumbing contract for the same building for \$1097.

PROPOSALS are asked for, until June 19, for heating and ventilating the High School Building, at Cleveland, Ohio.

HENRY WILLARD, Milford, Mass., has been awarded the contract for putting in the heating apparatus in the new Congregational Church at Franklin.

THE COUNTY COMMISSIONERS have contracted with James H. McPartland of Houlton to put in the plumbing and heating apparatus in the addition to the Court House, and have employed Chas. A. Swett to superintend the work.

FOSTER BROS., Danbury, Conn., are getting out plans for a double house on Pearl street for Dr. Wm. Bulkeley, and will have furnace heat and modern improvements.

C. B. FINCH has recently started in as a plumber in West Haven, Conn., and has the contract for plumbing the new house on Richards place for Albert Siebold.

OVER A CARLOAD of Exeter radiators are being used in the Convent of Mercy, Providence, R. I., by Lynch & Woodward, heating contractors, of Boston. The Hotel Plaza, at Boston, which is being heated by Ingalls & Kendrick, is also being supplied with Exeter ornamental steam radiators, 123 being used.

SEALED PROPOSALS will be received at the office of the Supervising Architect, Washington, D. C., until June 26, for a low pressure, return circulation, steam heating and ventilating apparatus for the United States Post Office Building, at Burlington, Iowa, in accordance with drawings and specifications, which may be ob-

tained at the office of the superintendent at Burlington or from the Supervising Architect, Washington.

IT IS REPORTED that the Maine World's Fair Building, now being erected at Poland Springs, will have the most complete and elaborate system of plumbing of any structure in Maine.

H. E. BOTTUM, Coboes, N. Y., has the contract for tinning the roof of the car house of the Coboes City Railway Company and for the plumbing and steam heating on the Island schoolhouse.

THE COOPERSTOWN, N. Y., Union school district has voted \$8000 to build an addition to the present school building and to provide an efficient system of steam heating and ventilation.

THE BOARD OF DIRECTORS of the Wisconsin Veterans' Home, Waupaca, Wis., at its meeting June 5 adopted the plans of J. E. Brennan of the Lindemann & Hoverson Company for a central plant to furnish heat, light, water power and fire pumps. Lines are to be laid under ground to the six principal buildings, with a 160 horse power engine. The work, it is estimated, will cost \$10,000.

THE WELLS-NEWTON QUAY COMPANY, 237 and 238 Monadnock Block, Chicago, are to overhaul the steam heating plant in the Reaper Block, Washington and Clark streets.

J. J. WADE & SON, 276 Dearborn street, Chicago, have contracts for the plumbing, gas fitting and sewerage in the Atwood Building, Clark and Madison streets; J. D. Marshall Building, Hobie street and Hawthorne avenue, and in the two residences of C. L. Willey, Thirty-seventh street and Michigan avenue.

CHARLES C. BREYER, 187 West Division street, Chicago, has the contract for the plumbing and drainage in the residence of G. F. Mahler, 802 West Division street.

F. EICHENBAUM, 815 Armitage avenue, Chicago, is to do the plumbing and drainage in the residence of A. Jones, 306 Fullerton avenue.

WILLIAM READ, 345 Forty-second street, Chicago, has the contract for the plumbing and drainage in the flat building of A. Eckerman, 5266 Bishop street.

P. H. GUNDERMANN, 889 North Halsted street, Chicago, is to do the plumbing and drainage in the flat building of C. Lippman, 186 Centre street.

HARRIS BROS., 3239 State street, Chicago, have the contract for the plumbing and drainage in the flat building of Thomas Kelly, Thirty-fifth street and Washtenaw avenue.

J. E. HEDMAN, 656 West Division street, Chicago, is to do the plumbing and drainage in the flat building of M. Anderson, 265 Hirsh street.

PAUL JAEKKE, 42 Centre street, Chicago, has the contract for the plumbing and drainage in the flat building of J. Mau, Irving and Byron avenues.

KEEF & WARNOCK, 1105 Lincoln avenue, Chicago, are to do the plumbing and drainage in the flat building of M. Schroeter, Belle Plaine avenue.

SMITH & DORNEY, 1046 Northwestern avenue, Chicago, have the contract for the plumbing and drainage in the flat building of J. Mills, Lawndale and Wabansia avenues.

CHARLES WALTERS, 332 Blue Island avenue, Chicago, is to do the plumbing and drainage in the flat building of L. Reichardt, 930 South Lawndale avenue.

JOSEPH SCHEUR, 924 Lincoln avenue, Chicago, has the contract for the plumbing and drainage in the flat building of W. Mooney, 620 Seminary avenue.

E. HENNESSY & CO., 3251 State street, Chicago, are to do the plumbing and drainage in the residence of H. Schulenberg, 3623 Forest avenue.

WILLIAM S. VERITY, 229 West Randolph street, Chicago, is to do the plumbing and drainage in the three residences of S. Brown, 508 Oakdale avenue, 537 Nelson avenue and 117 Cosgrove avenue.

PETER FELTMAN, 1149 Lincoln avenue, Chicago, is to do the plumbing and drainage in the flat building of T. Frelbrandt, 650 Melrose street.

B. G. CARPENTER & CO. have been awarded the contract for heating and ventilating the new school at Kingston, Pa.

BIDS will be received at the office of the Custodian of the United States Custom House and Post Office at Gloucester, Mass., until June 26, for work, including the plumbing of the above named building. Specifications may be had at the Custodian's office.

ARCHITECT E. HILL TURNOCK, 110 Randolph street, Chicago, Ill., has completed plans for the Lincoln Park Palace Apartment Building for B. Edwards, publisher, Chicago. This handsome structure will be built of solid Jasper stone, nine stories in height and fire proof throughout. It will contain all the latest improvements and will be up to date in every particular. The Star lead pipe couplers, manufactured by the Star Coupler Company, St. Louis, have been specified and will be used in the entire lead and iron pipe plumbing in this building. The Star Coupler Company are justly proud of having secured this contract, especially as it is taken away from home, and expect to follow this with a number of other large buildings in the same city.

Le Genie Civil of Paris states that during the last winter, which was a season of exceptional severity throughout Europe, the railroads of Germany placed in operation a number of freight cars furnished with a heating system designed to counteract the effects of frost on the perishable products transported by them. On many former occasions when the temperature was exceptionally low, such freight had been entirely spoiled in spite of the most careful attention. In order to obviate such an accident the companies introduced cars furnished with a double wall between which circulated warm air obtained from a heater connected with the car. A thermometer in full view from the outside secured a complete control of the temperature in the interior of the car. The cars thus equipped were placed in service on the railroad which connects Coblenz and Wiesbaden with Berlin, and they made a weekly trip each way from December 4 until the end of February, 1895, during which time they carried, in excellent condition, such perishable commodities as flowers, vegetables, fruit, beer, wine, mineral waters, &c.

Governor Morton of New York has signed a bill passed by the State Legislature authorizing cities of the first class to make contracts with private corporations to furnish gas. The bill applies to New York, Brooklyn and Buffalo.

The *Australasian Ironmonger* says that some amusement has been caused in technical circles during the month by the publication in the daily papers of New Zealand of a paragraph seriously describing the prospects of the manufacture of aluminum from extensive deposits of ore found in the neighborhood of Albury, said to contain an unusually large proportion of the oxide. The estimated cost of the machinery required is \$2500 and it is expected that 60 pounds to 70 pounds of metal can then be produced per day; but the basis of the enterprise is that the wholesale price of aluminum is reckoned at about 50 cents per ounce, the retail market price being about \$1. As a matter of fact, aluminum in Australia is worth between 50 and 75 cents per pound.

Bonds of the Allegheny Valley Railroad, bearing 5 per cent. interest, and issued at 104, were underwritten to the amount of \$43,000,000 in London and \$5,000,000 in New York.

STOVE TRADE NOTES.

The Ohio Stove Trade.

Taken all in all the situation of manufacturers of stoves and ranges is encouraging, if not entirely satisfactory. A few founders in this section write that trade is increasing and that orders thus far are larger than at the corresponding time a year ago, but the majority note a very quiet period, in some instances leaving very much to be desired. Most of the advices received, however, were written during the prevalence of the heated spell of almost unendurable weather, but the recent rains and lower temperature have materially changed the situation. As far as the business outlook depends upon the crops, and at present they form the key to the situation, there is no reason to feel discouragement. As far as heard from there is not a manufacturer, not making repairs, who is not running full time and employing a full quota of men. In fact, founders show full faith in the present and the future, in getting out new lines of goods or improving and changing old patterns to meet the growing demands of the trade.

Even if the volume of new business is not flattering now, dealers and producers alike are receiving more inquiries concerning goods and prices, which encourages a hopeful feeling. The one drawback to the realization of a profitable season to the manufacturer, which has been referred to before, is the apparent indisposition among some producers to harmonize views. Raw material, fuel and iron especially, have and still are advancing, labor is being paid full wages, if not higher compensation, resulting in higher cost of the finished product, which must eventually result in higher selling prices. There is some complaint, however, that lower prices are being talked of, which action some manufacturers complain is hard to reconcile with the facts. The general impression, however, is that higher prices will be established soon as a natural adjustment to the new condition being developed.

The activity and strength in the market for pig iron, including both Northern and Southern output, is a most interesting and important feature at the moment.

SOME of the gas range manufacturers held a meeting in Toledo, Ohio, on June 5, for the purpose of talking over trade matters in their special line. It was a meeting very similar in character to those frequently held by stove manufacturers, and it was decided to hold another meeting in the near future. It

will probably take place in Cleveland, Ohio, the latter part of this month or early in July, when it is expected that representatives of nearly all the gas range makers will be in attendance.

ODD PLATES.

THE R. E. DIETZ COMPANY, with main office and factory at Greenwich and Light streets, New York City, have issued an exceedingly neat little pamphlet of pocket size relating to their leading specialties. While the greater portion of the pamphlet is devoted to the Dietz Standard tubular lamps and lanterns, a number of pages refer to the Dietz tubular oil stoves adapted for heating as well as cooking purposes. These stoves, we understand, have been greatly improved since they were first introduced and are now fitted with the company's improved patent burner, having cemented joints which facilitate operation, and the filler opening is arranged so that the oil can be seen. A removable extension shelf is so made that it can be placed at either side, and there is employed a new method of securing the burner plate to the oil chamber with packing underneath. The stoves are made of cast iron, and the construction of the burners and oil chambers is such that they can be easily replaced at small expense whenever required. The Dietz tubular oil stoves are made in several varieties, and are referred to as burning kerosene without smoke or odor. The Dietz No. 4 tubular radiator is of unique design and of such capacity that, it is claimed, it will comfortably warm a room 20 feet square in the coldest weather. It is 21 inches long, 14 inches wide and 30 inches high and has four 4-inch burners. The oil chamber holds 5 quarts of oil, which is claimed to be sufficient to burn ten or twelve hours. The Dietz No. 4 tubular parlor heater is another ornamental construction especially adapted for parlors, offices or conservatories. It has a mica door, which is removable, leaving an opening for a kettle. This stove is also provided with four 4-inch burners. The Dietz new double cylinder gas heater is made in three sizes and is referred to as very powerful in operation.

WE HAVE BEFORE US a copy of a very attractive publication entitled "Headlight," devoted to the interests of railroads and railroad centers, and issued by the Chicago Photo-Engraving Company. It is designated as the "Albion Edition" and contains interesting reference to the leading industries in and about that place. Several pages are devoted to a description of the plant of the Electric Oil Stove Company of Homer, Mich., interior views being presented of the testing room, tin and sheet iron room, shipping department and brass workers' department, as well as a general view of the office and works of the company. General and broken views of the Electric heater and Electric cook stove, together with portraits of the various members of the company, are likewise presented. The statement is made that the business

of the Electric Oil Stove Company is rapidly increasing and that large shipments are annually made to European countries.

THE DIGHTON FURNACE COMPANY of North Dighton, Mass., have issued an illustrated pamphlet of the Winthrop wrought iron furnace and the Winthrop combination heater. The goods are illustrated by means of sectional views and the descriptive text covers the essential features of construction. The makers state that the Winthrop wrought iron furnace is the result of close observation and careful study and in presenting it to the public they do so with full confidence in its merits. It is constructed of the best material and by experienced workmen. Illustrations are given of the grate section of the furnace, showing the Smyth triangular grate; also the Winthrop check damper for smoke pipe. Several pages are given to testimonial letters from some of those who have used the company's goods, the illustrations consisting of buildings heated by the Winthrop furnace.

WE HAVE RECEIVED from Clerkin & Maag of Akron, Ohio, a little pamphlet illustrating and describing what is known as the Twentieth Century furnace. This is a new construction, having been patented in December of last year. The heater is so made that a hot blast is provided to all the fuel and gases without the use of complicated attachments. The manufacturers state that the fire pot is cast in one piece, having cells and slots entirely around it so that the air before mingling with the fuel is thoroughly heated, while at the same time the gases are set free. The arrangement is also such that air passes up through cells, where it becomes properly heated, "consuming the gases and volatile products of combustion." The ash pit is large and all parts of the grate can be put in position or taken out through the ash pit door. The grate is of the shaking and draw center type, made in two pieces, while the grate rest is in the form of a three-legged stool, bolted at three points of the ash pit, thus preventing sagging. The radiator of the furnace is corrugated in form and self cleaning. The bottom is pitched to an angle of 45 degrees, so that no ashes and soot can lodge at any point of its heating surface. A self cleaning two-way diving flue is bolted on the outside of the radiator and inside of the casing. It is made of cast iron, and being outside of the radiator the claim is made that it will not burn out, while being inside the casing the full benefit of its heating surface is given to circulation.

THE CENTURY STOVE COMPANY of Dighton, Mass., have issued from the press a neat little catalogue illustrating some of their specialties in the way of parlor stoves and ranges. They are also sending out a supplement showing their latest productions. Among these is the Century Grand, a six-hole range of attractive embellishment and embodying the modern features. Under the name Our Century the company are offering a first-class medium priced six-hole

range of rich ornamentation. The manufacturers state that this stove has many improvements not found in the higher constructions. Under the name Century the company are offering a neat square parlor stove made in two sizes. Under the same name they make three sizes of a sheet iron cylinder surface burner having draw center grate, anti clinker door, fancy side panels, &c. The Gem Century is another sheet iron cylinder surface burner, made in three sizes, while the Coral is a round parlor heater which is meeting with a large sale.

THE BAXTER STOVE COMPANY of Mansfield, Ohio, have issued a very neat supplement containing illustrations of their Banner steel range, which is offered in five different styles. This stove is one of the latest additions to the company's assortment and embodies features which cannot fail to interest the trade. It has balanced oven doors, duplex grate for hard coal and shaking and draw center grate for soft coal; oven bottom made of No. 10 steel, and so fastened in place that it can be readily taken out and replaced; end shelf, &c. We also have from the company a circular illustrating the Regal Banner, which is referred to as a new departure in wood cook stoves. The ornamental features are attractive, and the stove is made with balanced oven doors which when open give a large and substantial shelf on a level with the oven bottom. The stove is offered in three sizes and the usual modifications. The company have improved their Favored Banner cook stove, giving it a flush top and adding a top side shelf. Similar changes have also been made in connection with their Majestic Banner. Still another novelty is the Columbian Banner, an attractive four-hole cook, made in three sizes and embodying the modern features.

CHARLES E. COLEMAN, representing Eugene Muddell & Co., 218 Water street, New York City, has been mailing a letter to his friends in the trade announcing that he will soon visit them in the interests of the Manhattan line of stoves and ranges and other specialties which the company manufacture.

TERSTEGGE, GOHMANN & Co. of New Albany, Ind., are about erecting on Sycamore street a three-story brick structure 60 x 132 feet in plan. The addition has been found necessary to meet the growing demands of the company's business.

THE SOMERSET STOVE FOUNDRY COMPANY of Somerset, Mass., successors to the Boston Stove Foundry and the Somerset Co-operative Foundry Company, have issued a catalogue of Somerset stoves, ranges and heaters. It is a 40 page publication, bound in flexible covers and arranged with an eye so that it may be hung up for reference. The goods shown cover a wide range and in connection with each is given more or less descriptive text of interest to the dealer. The company state that all goods are made from patterns designed under their supervision and that neither time nor expense has been spared in making the goods first class in every particular. The ranges are offered under such names as the Somerset Grand, Wyoming, Somerset G, Grecian, Matron, Somerset Jewel, which is the company's Columbian production; the Harvest Arion and the New Pallas. The heaters include the New Somerset sheet iron surface burner; the Arion, another member of the same class; the Cheerful cottage parlor stove, and the Leo, a

round surface burner. Attention is also given to stove repairs and miscellaneous hollow ware.

THE COLUMBIAN GARLAND STEEL RANGE which the Michigan Stove Company of Detroit, Mich., have lately brought out is a very substantial construction adapted for using any kind of fuel. It is made both four and six hole and has extra heavy front oven door frame, double oven bottom, interchangeable reservoir system, heavy portable grate and pedal arrangement for opening and closing the oven door. The range has aerated oven; has counter balanced oven door made of extra steel and top oven plate, and it is protected with cast iron plates with an air space between.

IN THE COLUMN devoted to Detroit commercial travelers in a recent issue of the Detroit *Evening News Weekly*, is an interesting article, of which James B. Rue, representing the Peninsular Stove Company in the State of Michigan, is the subject. A likeness of Mr. Rue is published, together with a brief sketch of his business career. Reference is also made to the extensive plant to the company he represents as well as of the goods manufactured. The point is made that Mr. Rue has met with such success that the term "Peninsular" is a household word throughout the territory he covers. He is described as a man of unusually quiet disposition, yet of such genial and affable manner that he has made hosts of lasting friends.

THE NOVELTY MFG. COMPANY, Jackson, Mich., last week filed a suit for an injunction in the United States Court, at Detroit, against the Coldwater Oil Stove Company. It is claimed that the defendants are infringing one of the patents of the plaintiffs, who ask that an injunction be issued to restrain the defendant from manufacturing certain stoves while the merits of the case are being examined.

JUDGE WAKEFIELD of the District Court has ordered that the plant of the Sioux City Stove Works, at Leeds, Iowa, be sold at receiver's sale, June 15.

WHITE, WARNER & Co., Taunton, Mass., manufacturers of the well known line of Household ranges, are delighting thousands of little children in New England by the distribution of a beautiful set of dolls which they offer to send to all children who will forward their name and address.

BRIDGE & BEACH MFG. COMPANY, St. Louis, Mo., closed down their entire plant on Saturday, 8th inst., to allow their employees to attend the annual picnic given by the Bridge & Beach Mutual Aid Association. There are 300 members in this association, and they with their friends left on board the steamer "Grand Republic" at 9 o'clock for Montezano, where the picnic grounds are located. The excursionists numbered about 2000, and the day was pleasantly spent by them on the river and at the grounds. This association is composed of the employees of the Bridge & Beach Mfg. Company, and was organized four years ago for the purpose of rendering aid and assistance to its members in case of sickness or death. It has been very prosperous from its inception and now has a large surplus in the treasury.

THE THATCHER FURNACE COMPANY, 240 Water street, New York, during the past week shipped six carloads of furnaces, ranges and hot water heaters to their agents located in the prin-

cipal cities of the West and Northwest. Their sales so far this year are reported to have been double what they were a year ago.

THE PENINSULAR STOVE COMPANY of Detroit, Mich., favor us with a copy of what is known as Catalogue and Price-List No. 10. It consists of 56 pages devoted to hot water heaters and warm air furnaces for heating and ventilating buildings of all kinds. The printing is upon a good quality of paper and the binding is in attractive paper covers. The Peninsular goods are illustrated and described in a way to interest the dealer, and in addition to broken views of the heaters there are given tables showing the sizes made, the dimensions of fire pots and radiators, cold air box, number of brick required for setting, heating capacities, prices, &c. There are also given views of the foundation for a portable furnace when air is taken in under the floor, and of a brick set foundation showing cold air connection when the air is taken in above the floor. Dimensions of galvanized iron casings for Peninsular furnaces are given, as well as sizes and capacities of pipes, registers, &c. The last pages of the catalogue shows a bird's eye view of the works and general offices of the company at Detroit, their Western warehouse and offices at 78-81 Wabash avenue, Chicago, Ill., and their Eastern warehouse and offices at Buffalo, N. Y. Accompanying the catalogue is a folder relating to furnace pipe.

THE WORKS of the March-Brownback Stove Company at Pottston, Pa., were visited by a rather disastrous fire on the morning of Friday, June 7, when their molding room, pattern house, engine and cleaning rooms were destroyed. Fortunately their large warehouse containing an assortment of upward of 8000 stoves escaped the flames and the company are in shape to fill first orders. It is the intention of the company to rebuild at once, and they expect in the course of two or three months to be in a position to supply all demands of the trade.

THE THATCHER FURNACE COMPANY, 240 Water street, New York, are distributing monthly among architects, plumbers and fitters a desk blotter, on one side of which is a calendar for the month, together with a neat advertisement calling attention to the Thatcher furnaces and ranges and the Champion steam and hot water heaters manufactured by the firm.

BYRAM & Co., Detroit, Mich., manufacturers of the Collihan cupola furnace, have recently furnished to the F. P. Glszler Company, Chelsea, Mich., a 54½-inch furnace of that type.

RATHBONE, SARD & Co., for whom I. N. Thatcher is local agent, are showing in their New York salesrooms, lately removed from 254 Water street to 115 Beekman street, an interesting assortment of Senator, Snap, Citizen and Colonist ranges, of which the first named is very popular in the New York market. The company are also represented by J. D. Marvin, who visits the trade in New York City and vicinity.

"HOOD FURNACES AND COMBINATION HEATERS" is the title of a tastefully printed pamphlet which reaches us from the Hood Furnace & Supply Company of Corning, N. Y. The body of each page of this publication is of a brownish tint and of such shape as to give the appearance of a panel, about which is a white border. The printing is in black and the binding is in muslin

covers with embossed side title. The early pages are devoted to interesting remarks relative to heating and ventilation, and one page is devoted to a diagram of the company's plant, showing their railroad connections. The Cheerful Home furnaces in various sizes are illustrated and described, as well as the Cottage Home, which is offered in five sizes. The Cheerful Home combination heater is illustrated and described and there is given a long list of testimonials from some of those who have used the company's goods.

THE DETROIT STOVE WORKS now exhibit in the sample room of their Chicago branch specimens of the new coal cook stove named the Detroit Jewel. Although this stove has been brought out to be sold at a low price, it is nevertheless far from being a cheap stove in either appearance or construction. The molding is in the rococo style of ornamentation, presenting a decidedly rich effect. The construction is modern in every respect. The stove is furnished either in square form or with reservoir, and with 16, 18 and 20 inch ovens. A new wood heater, cottage style, is also shown. This is similarly treated in rococo design and is very handsomely dressed, being profusely ornamented with nickel. It is built with a diving flue down the front and also with direct draft. Three sizes are made. Other new goods are being brought out for the fall trade which have not yet been shown to the general public, but are expected to be trade winners.

S. S. JEWETT & Co.'s Chicago warehouse is not now so conveniently situated for visitors as in the days when it was located in the heart of the wholesale district. But Manager F. A. Root finds it all right for the transaction of business as at present conducted. The location is at 2050 Grove street, in immediate proximity to several of the leading railroad lines running out of Chicago, with which it is connected by a side track. The rear abuts on the Chicago river, where a private dock enables vessels to be unloaded whenever cargoes of stoves are forwarded by lake from Buffalo. But this, by the way, does not often happen these days, as railroads compete too closely for lake lines to secure much business in hauling stoves. The warehouse is well equipped for handling a large trade and manager Root hopes to see it come.

The New York Chamber of Commerce and the Board of Trade and Transportation of that city are urgently demanding that high pressure water service be provided for the extreme lower section of the city, in order that the high buildings which now prevail in that section may have a better protection against fire than is at present the case. The municipal water engineers claim, however, that any system having service that would carry water to the tops of the high buildings would be very expensive and would involve a serious leakage from faucets and connections placed considerably lower than the maximum point. They contend that a pressure that will carry water to five or six stories, the height of an ordinary building, is all that can be expected under present conditions. In the case of extraordinarily tall structures the owners will probably be obliged to insert their own pumping arrangements for fire protection and water service. It is pointed out that by furnishing motive power for elevators and

other light machinery a pumping system of this description may be made to pay for itself.

London, Paris and New York.

The following statistical comparison of the three leading cities of the world is made by the *New York Herald*: New York, by the census of 1895, is a city of 2,000,000 inhabitants. The population of London is 4,200,000. The population of Paris is 2,400,000.

The area of London is 75,000 acres. The area of Paris is 18,700. The area of New York is 24,000.

London has 600,000 houses. Paris has 90,000 houses. New York has 115,000 houses. London averages seven residents to a house, Paris 25 and New York 18.

London has 1390 miles of streets. Paris has 600 miles of streets. New York has 575 miles of streets. London has 2300 miles of sewers, Paris has 410, New York has 444.

The water supply of London is 175,000,000 gallons a day. The water supply of Paris is 100,000,000 gallons a day. The water supply of New York is 190,000,000. New York stands at the head of the three chief cities in this particular.

London has 1000 firemen, Paris has 1500, New York has 1100. For speed and efficiency the New York department stands at the head of the three cities. Fires are much more frequent, in proportion to the population, in New York than in either London or Paris. London loses \$7,500,000 a year. Paris \$1,500,000 and New York \$5,000,000.

There are 12,000 cabs and 2500 stages in London. There are 8000 cabs and 1250 stages in Paris. There are 1000 cabs and 300 stages in New York.

The municipal expenses of London are \$70,000,000. The municipal expenses of Paris are \$65,000,000. The municipal expenses of New York (State taxes included) are \$40,000,000.

The death rate in London is 21 per 1000 population; in Paris, 28, and in New York, 21. The number of deaths in New York City last year was 41,000; in Paris, 67,500, and in London, 89,000.

London has 14,000 policemen, Paris has 6000 policemen, New York has 3800 policemen. The ordinary arrests in New York in a year are 85,000; in Paris, 100,000, and in London, 150,000.

Street lighting costs \$2,800,000 in London, \$3,500,000 in Paris and \$500,000 in New York. Gas was introduced in London one year in advance of Paris. Eight years later it was introduced in New York. London has 75,000 street lamps. Paris 50,000 and New York 28,000, exclusive of electric lights.

London was founded in the year 60. Paris was founded in 860. New York was founded 1614. All three are on rivers. London is 60 miles; Paris is 111 miles from the sea.

The number of railroads entering London is 14. The number of railroads entering Paris is 8. New York being chiefly on an island, is actually entered by 5 railroads only. By ferry it is entered by 12 more—in all 17.

The number of inhabitants per acre in London is 50, in Paris 120 and in New York 80. The density of population in London is greatest in the White-chapel district, in Paris in the Temple district (290 per acre) and in New York in the Tenth Ward (Jewish quarter), 700.

A New Fire Lighter.

An ingenious device described in the *London Ironmonger* has been brought out in England, by the adoption of which the use of wood, paper, &c., in starting a fire is dispensed with. The mechanical arrangement consists of a fan, driven by a clock work mechanism, which is wound up by a crank. Directly in front of the fan is the blast pipe and a small open chamber, which is filled with asbestos fiber, soaked in paraffine oil. The apparatus is inclosed in a neat fitting case and so adjustable that it can be placed in front of any coal grate. When so placed the asbestos is lighted with a match and the fan set in motion by a small lever. The blast of air from the fan drives a highly oxidizing flame into the fuel and causes it to burn quickly. The igniter flame is allowed to die out in a very short time, but the fan continues to act as a forced draft, producing a good burning fire in a very short time. There is no danger from explosion, as the cavity for holding the oil is very small, and its cost for lighting 50 fires would be only a few cents.

Some New Uses of Aluminum.

The following new uses of aluminum are recorded in the *Aluminum World*: Aluminum lined cooking utensils are made from a solid plate of strictly pure aluminum inside, superimposed under pressure upon a sheet of steel outside. They claim the advantage of being strong, stiff, light and everlasting. This ware, they say, can be used against the bare flame without scorching. Aluminum wire is increasing in use, and if it continues to cheapen may be the wire of the future. Its electrical conductivity is three times that of iron, and more than half as great as copper, while its tensile strength is one-third that of steel and its resistance to corrosion phenomenal. We have received a number of inquiries for aluminum bedsteads. A novelty is a bouquet holder for use in cemeteries on Decoration Day and during the summer months. A cone shaped holder contains the water, into which the stems of the flowers are inserted, holding them erect and preserving their freshness. The cone terminates in a rod which is forced into the earth. It is painted green, to have the color of the grass. Aluminum burial caskets are in great demand in the trade. The experiment of making caskets from the light material is only eight months old. The cost of aluminum caskets is about the same as ordinary metal ones. They are practically indestructible. The signal lights of the Cup Defender will be made of aluminum. A lamp of aluminum weighs 1½ pounds without the glass.

A cellulose paint adapted for the protection of iron and metal surfaces, which is described by the *Practical Engineer* of London, consists of a 10 per cent. solution of ordinary wood pulp, to which may be added any coloring matter desired. At the moment of using the paint there is to be added to it some sort of siccative, such as an acid salt of lead or manganese. The paint finally becomes insoluble, affords a good protecting covering and does not scale off like other paints and varnishes. It may become immediately insoluble and resistant by a second coat of one of the siccatives named above.

TRADE REPORT.

The Iron Market.

The past week has been one of the most stirring in the history of the Iron trade for many years. It presents an unbroken record of advances all along the line, and few are left who would characterize the upward movement as a "soda water rise." The most extraordinary thing is that the upward tendency has developed so fast without the powerful aid of heavy purchases from the principal consumers, the railroads. It is true that the railroads have been buying a little more liberally, but it is certain, too, that they have not yet taken hold as they will if finances get into better shape and crops do better than the earlier scare stories would indicate. This may make this summer an exception to the usual dullness of that season.

The central West leads in the advance and the boom feeling prevailing there seems justified, because there is practically no reserve capacity either in furnace plant or Steel works. It is really only in Chicago that such a reserve does exist anywhere west of the Alleghany Mountains. It is very different in the East, and so far as Pig Iron is concerned, in the South, and notably in Virginia.

The rise in Steel and the difficulty in getting Tin Plate Bars is making the domestic manufacturers of Tin Plate nervous over the danger of being forced to surrender a part of their market to foreign makers. It looks as though heavier imports of Black Plates are unavoidable.

In Foundry Iron there have been heavy sales in Cincinnati. The Southern furnaces have advanced prices 25c. per ton, and in Chicago local Foundry Iron is up 50c. The market is stiff and is rising in the East. The announcement is made that the Tennessee and Sloss companies will establish a joint sales agency. Other Birmingham companies are talked of as being ready to join the movement, but in the case of at least one of them no credence is attached to this report.

Pig Iron.—In the New York market there has been a further advance of 25c. per ton on the part of the Southern furnaces. Reports that the Pioneer and Woodward Companies had joined in the proposed joint sales agency of the Tennessee and Sloss companies cannot be confirmed here, nor is it considered likely that the first named will participate in the arrangement. There has been a good volume of buying and little resistance to the upward tendency on the part of buyers. Some of them have old options which they are prompt to avail themselves of. The makers of Standard Northern brands are calling upon consumers to take what Iron is due on contracts until July 1 at the penalty of canceling. One prominent company has already secured a further advance of 50c. a ton on deliveries beyond July 1, and it seems likely that a further advance will be decided upon. We quote \$12.50 to \$12.75 for No. 1; \$11.50 to \$11.75 for No. 2, and \$10.75 to \$11 for No. 2 Plain, and \$10.25 to

\$10.50, Northern brands, tidewater delivery Southern Iron, same delivery, is selling at \$12.25 to \$12.50 for No. 1; \$11.50 to \$11.75 for No. 2; \$11.25 to \$11.50 for No. 3; \$11.25 to \$11.50 for No. 3 Soft, and \$11.50 to \$11.75 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$10.75 to \$11.

A remarkably strong feeling is reported as pervading the Pig Iron market in the Philadelphia district. Foundry Irons are firm and a shade dearer, but they are relatively less sought for than those for mill purposes. It is not thought likely that much further advance will be made at present, as the fact of other furnaces going in blast will tend to allay fears of scarcity for some time to come. Every advance in the selling price will tend to increase the supply, so that unless something very unforeseen occurs prices are not likely to work very much higher, although a decline from prices now ruling seems to be extremely improbable. Orders from furnaces to their agents have in some cases been very imperative to sell no more Iron pending further instructions, and in all cases unusual caution is observed in regard to quoting on large lots. It is difficult to quote with exactness, but in most cases Philadelphia deliveries command about the following prices:

Standard No. 1 Foundry X.....	\$12.25 to \$12.75
Standard No. 2 Foundry X.....	11.50 to 11.75
No. 2 Plain.....	11.00 to 11.25

Manufacturers of local Coke Iron in the Chicago district advanced their prices 50c. Business was checked to only a slight extent by the advance, a considerable number of contracts having been placed at the higher rate. Consumers who are endeavoring to place orders for long delivery are now being quoted an advance of 25c. for each quarter of the year, making a price of \$1 per ton higher for the last quarter than current rates. The indications point to a scarcity of Pig Iron in the late summer or early fall, which is a contingency that was not regarded as possible only a few weeks since. Southern Coke Iron has been marked up. Only one large Southern company is in condition to take business, and it is quoting higher prices for future delivery. Buyers are showing a disposition to speculate on the future and are endeavoring to place contracts considerably in excess of what it is believed they will require. A good demand has been felt for Lake Superior Charcoal, but in small lots. Quotations are as follows, for cash:

Lake Superior Charcoal.....	\$13.00 to \$13.50
Local Coke Foundry, No. 1.....	11.00 to 11.50
Local Coke Foundry, No. 2.....	10.75 to 11.00
Local Coke Foundry, No. 3.....	10.25 to 10.75
Local Scotch No. 1.....	11.00 to 11.50
Ohio Strong Softeners, No. 1.....	13.00 to 13.25
Southern Silvery, No. 1.....	12.25 to 12.50
Southern Silvery, No. 2.....	11.75 to 12.00
Southern Coke, No. 2.....	11.00 to 11.25
Southern Coke, No. 3.....	10.75 to 11.00
Southern, No. 1 Soft.....	11.00 to 11.25
Southern, No. 2 Soft.....	10.75 to 11.00

There is an improved demand for Foundry Iron in the Pittsburgh market, but prices are without recent change. Quotations are as follows, Pittsburgh delivery:

No. 1 Foundry.....	\$11.00 to \$11.25, cash
No. 2 Foundry.....	10.50 to 10.75

Advices from Cincinnati indicate that activity, strength and buoyancy are the chief attributes of the local Pig Iron market at present. Large sales and heavier inquiries have stamped the week under review with the seal of confidence. A further advance of 25c. per ton has been established on all grades of Southern Iron. The volume of business during the week has been quite large in the aggregate, the transactions embracing upward of 40,000 tons. Pipe foundries and other large melters of Iron have been in the market, the former alone taking about 10,000 tons. Aside from this, the largest individual transaction was one of 4000 tons Foundry grades, but there have been a number of 1000 ton orders and a host of 500-ton lots, and when the returns are all in and checked up it will be strange if furnaces do not check the active buying by another substantial advance in prices. That buyers are anticipating their wants liberally seems to be clear, but beyond this the movement seems to be free from speculative influences. Quotations are given as follows:

Southern Coke, No. 1.....	to \$10.50
Southern Coke, No. 2.....	to 10.00
Southern Coke, No. 3.....	to 9.75
Southern Coke, No. 1 Soft.....	to 10.00
Southern Coke, No. 2 Soft.....	to 9.75
Ohio Soft Stone Coal, No. 1.....	14.50 to 15.00
Ohio Soft Stone Coal, No. 2.....	14.00 to 14.50
Lake Superior Coke, No. 1.....	11.75 to 12.25
Lake Superior Coke, No. 2.....	10.75 to 11.50
Hanging Rock Charcoal, No. 1.....	to 11.50
Hanging Rock Charcoal, No. 2.....	to 11.00
Hanging Rock Charcoal, No. 3.....	to 10.00
Tennessee Charcoal, No. 1.....	13.50 to 14.00
Tennessee Charcoal, No. 2.....	12.50 to 13.00

At St. Louis the situation in Pig Iron is extremely strong. Consumers are increasing their orders and furnace agents are asking full prices. Prices have again been advanced 25c. per ton, making No. 2 Foundry \$10.50, f.o.b. cars St. Louis. This last advance makes a gain of \$1 per ton over the lowest figures quoted, and at the top prices ruling today a larger business is being transacted than when prices were at their lowest a few months since. Locally there is a steady increase in consumption, and some of the heavy consumers are endeavoring to fill their wants for the balance of the year, but are unable to do so at to-day's prices. The situation is one of considerable strength and indications point to higher prices in the near future. We quote as follows, for cash, f.o.b. St. Louis:

Southern Coke, No. 1 Foundry.....	\$11.00 to \$11.25
Southern Coke, No. 2 Foundry.....	10.50 to 10.75
Southern Coke, No. 3 Foundry.....	10.25 to 10.50
No. 1 Soft.....	10.50 to 10.75
No. 2 Soft.....	10.25 to 10.50

Metal Market.

Pig Tin.—The market has suffered very severe depression. Wholesale prices have fallen fully 4c. per lb. Many long contracts were closed out on the decline and Tin has been sold for short account to a considerable extent as well, while every opening among out-of-town dealers and consumers received the careful attention of prominent local operators, some of whom sold at prices closely in line with contract rates for both prompt and future delivery. The

decline was a natural outcome of largely excessive supplies and inability or unwillingness of the late bull interest in the European markets to contend against the adverse influences. In the local market there is nothing that as much as suggests a bull interest. Later in the week some reaction in prices occurred, and the feeling seemed favorable for a further rise, but operations were on a rather smaller scale. The jobbing demand has been fair, small lots of Strits Pig from store are quoted about $\frac{1}{2}$ ¢. lower, or at $15\frac{1}{2}$ ¢. to $15\frac{3}{4}$ ¢. per lb.

Copper.—The depression in Tin and lower quotations from London on Copper have operated to restrain buying in this market to some extent and prompted lower quotations, based solely upon what certain interests thought should be proper under existing circumstances. When it comes to the matter of actual business, facts are wanting to make it clear that there has been any decline, except possibly in the shape of slight concessions on small lots from second hands. Jobbers' price for Lake Ingot in moderate sized lots is $11\frac{1}{2}$ ¢. to $11\frac{3}{4}$ ¢. per lb. It is general report that consumption is heavy on both sides of the Atlantic, particularly in this country, and that the outlook is very promising for the near future.

Sheet Copper.—A good demand for Cornice Copper continues, both on account of increased current requirements and for stock. Prompt shipment is required in most cases, but some substantial contracts for future deliveries have been placed during the week. Small lots of Sheet Copper from store are still quoted at the net price of $14\frac{1}{2}$ ¢. per lb., but an early advance in the list on manufactured Copper is regarded as among the probabilities. The likelihood of an advance in price has apparently stimulated consumers to place their orders at once.

Pig Lead.—Operations have been on a smaller scale the past week, but the market has lost nothing in strength and tone. The demand from consumers has been of a healthy character, and retail prices have continued firm, at $3\frac{1}{2}$ ¢. to $3\frac{3}{4}$ ¢. for small lots of American Pig from store.

Lead Pipe and Sheet.—In its general character the demand for Manufactured Lead maintains the improvement referred to in our last week's report. Inquiries are active from consumers of plumbing supplies, as many buildings are now advancing to the point at which the plumbers' work must be attended to. So far no advance has been made in the price-list on Sheet Lead and Lead Pipe in this section, although Shot has been marked up this week. Prices are, however, stiffening materially. Lead Pipe in small quantities from store is quoted at $5\frac{1}{2}$ ¢. and Sheet Lead at $6\frac{1}{2}$ ¢., subject to the usual discount.

Spelter.—Dealings have been on a smaller scale the past week and the demand has moderated considerably also. In other respects the market is unchanged. Smelters are as reserved as formerly in their offerings and stand out firmly for the highest prices reached of late. In some instances there were point blank refusals to consider offers below $4\frac{1}{2}$ ¢. for wholesale lots of best Western brands. In small jobbing parcels good Western Spelter rules at $4\frac{1}{2}$ ¢. to $4\frac{3}{4}$ ¢. per pound.

Sheet Zinc.—This material holds its own in point of firmness. Stocks are

still light and the demand fairly active. The stringency which has been felt for the past few weeks, however, gives signs of abatement, as the most pressing requirements of consumers are being gradually satisfied. The usual price for 600 lb. casks is $6\frac{1}{2}$ ¢., while broken lots rule at $7\frac{1}{2}$ ¢. per lb.

Antimony.—A routine jobbing business is about all that has been done. Prices are barely steady at $9\frac{1}{2}$ ¢. for Cookson's and $8\frac{1}{2}$ ¢. for Hallett's, in small retail parcels.

Nickel.—Sellers' figures remain at $35\frac{1}{2}$ ¢. to $40\frac{1}{2}$ ¢., according to quantity and terms.

Tin Plate.—A fairly large business has been done in foreign Cokes for future delivery, at about last week's prices. The demand from the canning trade is larger than was expected a short while ago. In the wholesale market spot sales are, however, still below the average. The quotations for Welsh Plates rule rather higher, on account of the restriction of production on the other side, as well as the large reduction in stocks which has taken place there lately. On June 1 the official returns of stocks of Plates ready for shipment at British ports showed 293,000 boxes, which is 104,000 less than the amount in hand on May 1, and the smallest amount since the boom of 1891, before the imposition of the McKinley tariff. The dwindling of foreign stocks is very marked as compared with a year ago, when stocks at shipping points amounted to 541,000 boxes. For this reason quotations on Welsh Plates are considerably stiffer, and some lines of imported Plates are at the present time virtually out of the market. The domestic mills are running full. The majority of them have contracted for the whole of their output as far ahead as August or September. Early deliveries of Domestic Plates are difficult to get, particularly as the delivery of Bars to the mills and of Black Sheets to the dipping plants is at the present time very slow. It is understood that some large contracts have been entered into by some of the newly started American works at ridiculously low prices. We have heard of one of 30,000 boxes, which was taken by a new concern at $25\frac{1}{2}$ ¢. a box below the current rate. With the recent rise in the price of steel, it is likely that this concern will find a heavy balance debtor at the termination of their contract. Other domestic manufacturers have marked up their price $2\frac{1}{2}$ ¢. to $5\frac{1}{2}$ ¢. a box from the lowest, on account of the recent rise in price of Bars and Black Sheets. A very fair current demand exists for American Terne Plates, and prices all around are firmer, although in very few cases do they show any quotable change.

A special London cable dispatch of June 12 to *The Iron Age* reports on the British Tin Plate market as follows: Tin Plate is firmer, with inquiry good. A few large forward lines have been placed at rather improved prices. Threatened strikes, however, hamper business. Among other transactions were fair lines of cheap grade Terns for America, but prices were cut fine. Quotations, f.o.b. Wales, are as follows:

Bessemer Cokes, $10\frac{1}{2}$ x $20\frac{1}{2}$, 9s. 3d. to 9s. 6d.
 Siemens Cokes, $10\frac{1}{2}$ x $20\frac{1}{2}$, 9s. 6d. to 9s. 9d.
 Terns, $20\frac{1}{2}$ x $28\frac{1}{2}$, 11s. to 22s. 6d.
 Charcoals, $10\frac{1}{2}$ x $20\frac{1}{2}$, 11s. to 13s. 6d.

Sheet Iron.—Almost every Sheet mill in the country is sold up to July at least, and some to a later date than that. The readjustment of the wage scale, which will occur in July has, however, prevented some of the manufacturers from making contracts be-

yond that date. It is a matter of the greatest difficulty at the present time to get prompt shipments of either Black or Galvanized Sheets, while stocks in jobbers' hands in this section are dwindling rapidly. The demand for Galvanized Sheets continues to be heavy, and considerable inconvenience is experienced by consumers in the inability to obtain reasonably early filling of their orders. Galvanized Sheets have again advanced, and in small or moderate sized quantities are not now obtainable under 70 and 5 to 70 and 10 per cent. off. Jobbers have also marked up Black Iron. No. 27 Common Iron, in small lots, is now quoted at $2.90\frac{1}{2}$ ¢. to $3\frac{1}{2}$ ¢. Black Plates for tinning purposes also show an advance and are in eager demand by the "dipperies."

Chicago Report.

Scrap.—The demand is growing larger. Dealers quote their buying prices as follows, Chicago delivery:

	Per net ton.	Per lb.
No. 1 Wrought Scrap.....	\$7.50	
Machinery Cast.....	6.00	
Malleable Cast.....	6.00	
Stove Plate (free of burr).....	4.50	
Burnt Iron and Grate Bars.....	2.50	
Sheet Iron and Hoops.....	2.00	
Plow Steel and Breaking Stock.....	3.50	
No. 2, such as Shovels, Hoes, &c.....	2.50	
Old Boilers—whole (iron).....	3.00	
" " (iron)—cut in single Sheets and Rings.....	5.00	
Old Gas-Pipe and Boiler Tubes.....	5.00	
Cast Borings.....	3.50	
Turnings.....	4.00	
Horseshoes.....	3.50	
Copper Wire and Heavy.....	7 ½¢	
Copper Bottoms.....	7 ½¢	
Copper Clips.....	7 ½¢	
Heavy Brass.....	6 ½¢	
Light Brass.....	3 ½¢	
Pipe Lead.....	2 ½¢	
Tea Lead.....	2 ½¢	
Zinc.....	3 ½¢	
Rubber.....	3 ½¢	

Anthracite.—Business is moderate. Carload lots of 12 net tons or over are quoted as follows:

	Egg, Sto.	Grate, and Ch.
Chicago, Ill.....	\$4.60	\$4.75
Milwaukee, Wis.....	4.40	4.75
Kansas City, Mo.....	7.80	7.95
Council Bluffs, Iowa.....	7.80	7.95

IN THEIR PAGE ADVERTISEMENT in this week's issue Sumner & Goodwin, Boston, Mass., manufacturers and jobbers of Wrought Iron Pipe, Steam Gas and Plumbing Materials, call attention to their Humboldt Basin, pointing out that it has a quick discharge, small fouling surface and no nickel plated work exposed in the basin. They also refer, with illustrations, to their Clamp and Testing Cover for iron hopper traps.

Trade Notes.

THE YOUNGSTOWN STAMPING WORKS, Youngstown, Ohio, were sold last week for \$13,815 to a committee representing the creditors of the concern.

CHARLES & Co. is the name of a firm which, it is reported, will establish canning works, with a capacity of 90,000 cans daily, at Warsaw, Ind.

THE HALF PAGE ADVERTISEMENT of the Model Mfg. Company, 128-130 Oliver street, Boston, Mass., which appears in this issue, enumerates some of the specialties which this concern are putting on the market. Model Mfg. Company are composed of men well known and experienced in the trade, who are taking a great deal of pride in the success of their venture, which is already assured. They invite the trade generally to give them an opportunity to quote figures on their lines.

THE DELANY HEATER & RHEOSTAT Company of New York City were recently incorporated, with a capital stock of \$100,000. J. R. Steers and E. T. Birdsall are named as directors.

THE PAGE ANNOUNCEMENT of the E. P. Barrett Mfg. Company, 81 Sudbury street, Boston, Mass., directs attention to the Zane Sanitary Water Closet, of which an illustration is shown, with the invitation that every one send for catalogue. A feature of the announcement is the testimonial letter from Tilly Haynes, dated April 5, 1895, Mr. Haynes being the proprietor of the United States Hotel, Boston, in which he used 50 Zane Closets, and later used them in all the new work in the Broadway Central Hotel, New York.

DEHAVEN & Co., LIMITED, Pittsburgh, Pa., are directing the attention

of the trade to their new line of Cinderella Kitchens. These are referred to as being all cast iron and adapted for burning hard or soft coal or wood. They are made in a variety of sizes, and many points of excellence are claimed for them. The firm also make a full line of stoves and ranges under the trade mark of "Cinderella." The trade are invited to send for catalogue.

FOLLANBEE BROTHERS' COMPANY, successors to James B. Scott & Co., Pittsburgh, Pa., are displaying a very generous spirit and one which their customers will be sure to appreciate. In their advertisement elsewhere in this issue they advise against delay in placing orders as prices are advancing. They announce that they carry large stocks of galvanized, common black, refined and patent plished iron, from which prompt shipments can be made. Other lines of goods handled by this firm are also noted.

THE SWARTS METAL REFINING COMPANY, 120-122 West Lake street, Chicago, report quite an improvement in business. They have been receiving a large number of orders throughout the country on the catalogue which they sent out three or four months since. The demand for all grades of metals which they handle is nearly double in number of orders, also in quantity. Among the orders they have recently filled is a large shipment for Salt Lake City, Utah, and several others for North and South Dakota. The prospect for good trade in the metal line has never been brighter.

GEORGE STARRETT, 227 and 229 Water street, New York, who is agent for the Craig Polished Sheet Steel manufactured by Kirkpatrick & Co., Limited, of Pittsburgh, is able to report a steadily increasing demand for this product from quarters in which Russia Iron was formerly used.

A strike occurred last week among the can makers in some of the Baltimore factories. The men claimed that it was too hot to work for the wages they were receiving—about \$1.20 a day. They demand an increase of about 85 cents a day.

The Philadelphia Ledger describes a new form of electric heater which was recently exhibited at the Franklin Institute in Philadelphia. It consisted of a series of glass tubes coated on their interior with quicksilver, similar to that used for mirrors. The tubes were electrically connected together, much in the same manner as steam pipes are in a radiator. The mercury deposit conveyed the electric current from tube to tube, and the resistance could be varied by various combinations of tubes. The resistance would also vary as the thickness of the deposit. The principle is applicable to plane surfaces also.

To detect lead in water, says an English exchange, put a small piece of iodide of potassium into a jug of water. If there is any appreciable quantity of lead in it the water will turn yellow.

The arrangements for the formal opening of the Harlem Ship Canal, on June 17, are completed. They comprise river and land parades, in which some vessels of war and regular troops will take part.

The Boston office of *The Metal Worker* has removed from 146 Franklin street to 33 Mason Building, 70 Kilby street.

Women Workers.

One of the most interesting features of a statement recently issued by the Census Bureau at Washington, regarding the number of persons engaged in gainful occupations in this country in 1890, is the evidence which it gives of the increasing number of women who are engaged in the industries and occupations formerly monopolized by the other sex. While the growth in the number of workers in the manufacturing industries during the ten years between 1880 and 1890 was 49 per cent., that in trade and transportation 78 per cent. and in professional service 56 per cent., the increased percentage of women workers under these classifications was even larger, amounting in the case of trade and transportation to as much as 263.25 per cent. Of the 22,735,061 persons, in 1890, engaged in gainful occupations, 18,820,950 were males and 3,914,711 were females. In 1880 the total number of persons so employed was 17,392,099, of whom 14,744,942 were males and 2,647,157 were females. The percentage of increase in the number of workers was 30.72. The male increase was, however, only 27.64, while the female increase was 47.88. The proportionate increase in female labor over 1870 is still more striking, as it amounts to 113.19 per cent., as compared with 76.4 per cent. on the part of the males. Thus, within a score of years, the number of women workers in this country has more than doubled, while the number of male workers has increased but 76 per cent. The most striking increases in the numbers of female workers are shown, not, as might be expected, in domestic and personal service, but in trade and transportation, in professional service and in manufacturing and mechanical industries. Among the employments

for women which have almost wholly developed within the last 20 years are clergymen, journalists and physicians. In these professional classes it is interesting to note that in 20 years the number of male clergymen just about doubled, while the female clergymen increased from 57 in 1870 to 1235 in 1890. Between 1870 and 1890 the number of male journalists as nearly as possible quadrupled, but in the same time the women journalists increased from 35 to 888. The number of men physicians increased in the same time only about 40 per cent., but the women physicians increased 900 per cent. Twenty years ago there were no women registered as chemists, engineers or surveyors, while in 1890 46 women are described as chemists or engineers and 127 as surveyors. In the list of various occupations given in the report it appears that women have invaded every department of industry and professional service excepting the army and navy.

The Harlem Ship Canal.

During the week the eyes of all Europe have been turned on the consummation of Germany's great commercial and maritime work, the Baltic-North Sea Canal, which was formally opened on Friday with imposing ceremonies. War vessels, representing all the navies of the world, joined the procession through the new and important waterway, affording the finest international naval display ever seen. The same week has witnessed a similar event, on a more modest scale, much nearer home, namely, the opening of the Harlem Ship Canal last Monday. In its influence on the commercial interests of New York City and State this event is one of great local importance. By the opening of the canal the waters of the Hudson River and Long Island Sound have been joined and some 14 miles of new water frontage in New York City has been made available for wharfage purposes. The new waterway will be also of immense advantage to traffic in saving some 20 miles of navigation through crowded water to vessels coming down the Hudson and bound for the East River or the Sound. The work is not yet completed. So far the canal has been finished only to a width of 200 feet and a depth of 15 feet. Eventually the waterway will be 400 feet wide and 20 feet deep. But the most important part of the work has been done, namely, the cutting through a hill of solid rock in order to secure a direct channel. About \$1,000,000 have been expended and the finished work will call for about \$2,000,000 more in order to reach the full proportions of the project.

Judging by Appearances.

"Appearances are deceitful," so goes the old saying, and there are few of us who have not learned by actual experience how far this is true. The man who is such a judge of human nature as not to be sometimes deceived is by long odds the exception rather than the rule. It is certainly in our relations to our fellow men that we most often are misled by appearances. By no means, however, is it true that we most frequently make the mistake of thinking that that which appears good and upright in a man is only a sham, and that beneath it all there lurks the sneak—the man without a character. Too often do we misjudge a man by his appearance and set him down as dishonest or incapable, when a little investigation or an opportunity to show himself at his best will convince us of our error. This false judging is too often evident in the experience of those who have the responsibility of selecting workmen in the various industries. A good workman does not always wear the evidence of his ability in his face, and there are few among us who cannot recall among the best workmen they know some men who at first glance would be set down as even lacking in common sense, to say nothing of mechanical ability. In all justice to such men, for whom nature seems not to have done all that she might, they should be given an opportunity to prove their worth. And this opportunity can only come through an effort on the part of the employer or his representative to select employees only after careful investigation and not to judge too largely by external appearances.

According to the complete returns of Director Preston of the United States Mint, the total gold production of the world in 1894 was \$181,510,100, which is an increase of \$22,074,000 over 1893, which was itself the year of largest previous gold production by over \$12,000,000. The most notable increase in production was in Africa, where the gain was \$11,400,000; in Australia, \$6,073,000; in the United States, \$3,500,000; and Mexico, \$3,195,000. The indications from the great producing regions, the director states, are for a corresponding gain during the current year, which will carry the gold production of the world to over \$200,000,000.

A much needed improvement has been taken in hand in New York City in the transformation of Mulberry Bend, one of the most notorious of the crowded and unwholesome slums of the city, into a small park. About 1000 families were last week turned out of the tenements in this district to seek more healthy quarters elsewhere.

THE LETTER BOX.

Casting Statuettes.

From T. C. Boston.—It is not surprising that "J. R. H." Hazelton, Pa., whose letter appeared in *The Metal Worker*, June 8, should experience some difficulty in casting statuettes when brass molds are used. Brass is a rapid conductor of heat, and when the melted alloy is poured in it becomes cooled before reaching all parts of the mold and incomplete castings are the result. After a number of attempts have been made the molds may become so heated as to allow the alloy to fill the space and thus produce a complete figure. As the molds become heated it takes some time for the alloy to cool so it can be removed and much inconvenience is the result. As a remedy for this difficulty it is recommended that the inside of the molds be smoked by means of a kerosene lamp or tar paper, thus covering the surface with carbon, which is a non-conductor of heat. This covering of "smoke" can be made very thin, so as not to change the shape of the figure.

There are various grades of "gold" bronze that can be used for giving the figures a bright gold color, providing the coating will be sufficiently durable. The following solution is said to be suitable for gilding bronze figures and gas fixtures, the operation being performed by immersion. Dissolve $2\frac{1}{2}$ pounds of caustic potash, 5 ounces of pearl ash (carbonate of potassium), 2 ounces of cyanide of potassium, in 5 quarts of water, in which must previously have been dissolved $\frac{1}{4}$ ounce of gold chloride. This solution must be heated nearly to boiling before using, and it is upon the temperature that the color will depend. The gilded surface can be worked up with a brush and whiting, finishing with rouge and burnishing. Before gilding the surface of the article should be scoured clean with a brush and some polishing powder. Any grease can be removed by rinsing in a boiling caustic potash solution.

Making a Smoke Test.

From R. C. J., Brooklyn.—Will you kindly state what material is best to burn in a smoke test machine? How much material would be required to fill a line of 4-inch pipe 100 feet long with smoke? Which point is best to make the test from, the cellar or the roof? Is the smoke test as effective in detecting leaks as the water test?

Note.—We shall be glad to have our readers give their opinions on this subject. Some plumbers who do pipe fitting use the oily waste which accumulates in the shop in the smoke test machine and put a little sulphur in with it. This makes a dense smoke in great quantity. Others prefer to use the tar paper such as is used in roofing, which seems to present some special advantages. One pound of sulphur and as much of the oily waste as will fill an ordinary bucket will furnish all the smoke required for the amount of piping mentioned. If the paper was torn in small pieces the amount that would fill two buckets would probably be required. The

paper can be more conveniently carried, as it comes in a roll and the quantity can be torn off as required. In the opinion of some plumbers the test should be made from the cellar, as the smoke is light and rises. In such cases one of the ventilating openings in the roof should be left open until the smoke commences to come out of it, when it should be closed. Where there is no convenient opening in the cellar for forcing in the smoke a satisfactory test can be made from the roof. The water test is looked upon as the most severe test that can be used, inasmuch as it presents a much stronger pressure and is equally searching in finding the leaks. It is generally considered that the smoke test is sufficiently effective for all ordinary work. It has advantages over some other systems of testing when applied to a building where the fixtures are in use, as the smoke is very penetrating and the pressure, being very light, does not disturb the water seal in the traps. The smoke gives off a very pungent odor and, with the slight pressure applied by the machine, will force itself out in little puffs wherever a leak is found.

Who Should Make the Connection?

From X., New York.—Will you kindly inform me who should make the connection between the water back and the boiler when the range and water back are furnished by a range dealer and a plumber has a contract for the plumbing work? In placing the ranges in a new building, in New York City, does the work of connecting the water pipes from the horizontal boiler over the range to the water back placed in it belong to the plumber when he has a contract for all the other plumbing work, or should the work be done by the party who sets up the range? In my opinion the range man is only required to set the range in position and connect it with the flue, the plumber making all water connections. Am I right?

Note.—We shall be glad to have our readers express their opinions on this subject. It would seem that so important a matter should be specified in the contract of either one or the other of the tradesmen and should not be left open to the customs of the trade in the city.

Tin vs. Galvanized Iron for Gutters.

From M. A. B., Sullivan, Ind.—Will the readers of *The Metal Worker* give their opinions regarding the relative value or durability of "Old Method" IX roofing terne and No. 26 gauge galvanized iron when used for gutters and valleys? The prevailing idea here among our local contractors and builders is in favor of galvanized iron, but

we contend they are in error. Would like the opinions of those having had experience in the matter.

Fan and Furnace.

From FOUNDRYMAN.—I have been noticing the drift of the furnace trade and am inclined to think that it has reached the parting of the ways. For a number of years the old method has been good enough with the best heating men, and the ambition of some has simply been to get prices down lower and to make price the sole argument in soliciting work. There have been, however, a number of furnacemen, widely separated, who have been eager for a more intelligent method of calculating the requirements of a heating plant, and without any opportunity of discussing the subject together they have been working separately to the same end. It is probable that some, in fact a large number, will always follow the present thumb rule, guess work, method of laying out a furnace plant, depending on personal judgment as a guide. I think it is just as probable that the men who understand the velocity of air currents, the difference in the weight of air at different temperatures, and who calculate the quantity of air heated to a given temperature that would be required for a given room have gradually absorbed the more profitable portion of the furnace business.

Articles leading in this direction have already appeared in print, and the heating engineer is devoting some of his valuable time to the study of the furnace system as a method of heating. In my opinion some of the reasons why furnace heating is so popular are its reasonable cost and the fact that it furnishes an influx of fresh, pure air. The dissatisfaction with some furnace plants can be directly traced to the lack of provision for the air to pass out of the building to make room for fresh, warm air. The irregular pressure in the cold air box due to the force of the wind has always made more or less trouble. I recognize two things which have come to my attention within the past year as of special importance in showing the tendency of the times. One is a system of ventilation in connection with a furnace, which by means of small pipes brings the air from the lower portion of the room to a chamber above the furnace, where, by means of the usual waste heat, it is raised in temperature and discharged into a ventilating shaft, which is built next to and warmed by the smoke flue. The other system which has attracted my attention was the fan and furnace system shown in *The Metal Worker* of May 25. There is every reason why this method should be more largely used for church heating and in other public buildings. The cost should not be a feature of disadvantage. That such a plant would cost double the price of a plant installed on the old system is probably true. It is equally true that in many churches the old system is repudiated, and a steam or hot water system, which probably costs more than the fan and furnace system, is used, which goes to show that it is not price alone which decides which system shall be used. The furnaceman who stands at the parting of

the ways and desires to take the right way will make a careful study of the use of fans in connection with furnaces, and will impress upon the builder, architect and client the importance of providing some means of ventilation so as to increase the advantages to be derived from the fan and furnace system.

How Can a Windmill be Attached?

From G. H., New York.—In reply to the inquiry from J. G. S., Norristown, Pa., which appeared in *The Metal Worker*, June 15, I would offer the following suggestions for an indirect connection for a windmill and pump, which I hope may prove useful to him. The bell crank shown in the sketch is a convenient and cheap method of connection. The bell cranks may be made of cast iron from a pattern that may be made by any carpenter; a forging, or may be made of heavy sheet iron with stiffening braces foruing the pin bearings. If the mill is at a distance from the house, say 100 or 200 feet, a No. 8 iron wire may be used to advantage with two or three supports on poles to keep the wire from sagging. In this arrangement, a counter weight, as shown at C in the cut, must be attached to the pump rod connection to keep the wire taut and carry the bucket down in any single acting force pump. If a double acting force pump is used then the T-shaped bell crank shown at E must be used, for in this class of pumps the pressure is alike in both up and down stroke. If the weight was used in this case it would need to be too heavy for the operation of the windmill. The wires should be tightly stretched, with the use of the T bell crank, to prevent lost motion. The connection with the head of the pump handle may

From BENNETT BROTHERS, Baltimore.—If "J. G. S.," Norristown, Pa., whose inquiry appeared in *The Metal Worker*, June 15, will put up his windmill like the drawing it will work all right. Let the rod from the

How Can a Windmill be Attached?—Plan Proposed by Bennett Bros.

will come down to the beam at A. Hinge the beam to the house at B, and run a rod to the pump D from C.

Sheet Zinc for Eave Troughs and Conductors.

From P. S., New York.—In answer to the inquiry of "N. K. W.," Stoneboro, Pa., in *The Metal Worker* of June 8, regarding the use of sheet zinc for eave troughs and conductors, it

How Can a Windmill be Attached?—Plan Proposed by "G. H."

be made with a wide yoke or Y clip, as shown at D, and a long bolt inserted to pass through the three pieces that form the joint. If at any time it becomes necessary to run the pump by hand, slipping the Y clip off, by withdrawing the bolt and keeping the pump handle connected, will be a quick way of disconnecting the mill. Where the windmill can be set within 25 feet from the pump a wooden rod makes the best connection, in which case the counter weight C will not be needed for any class of pump. The relative length of the arms of the bell cranks may be so arranged as to suit any length of stroke in the pump or mill.

appears that your correspondent has neglected an opportunity of determining the efficiency of the article by not examining the job of zinc work in his place that has been in use for about eight years. The condition that the above mentioned job is in would do more to determine the value of zinc for the purpose than volumes of theory. Speaking on general principles, zinc is not adapted for outside work, as heat softens the metal and cold makes it hard and brittle. The heat required for soldering appears to change the structure of the metal and causes it to become weak or rotten. On this account the trough might be so weakened

at the joints as to break. Zinc might be employed for eave troughs by using hangers that are not attached by soldering, and having them near together, thus doing away with any liability of sagging between supports. If sheet zinc is to be used for eave troughs and conductors there should be two or three times as many supports as are usually used for tin or galvanized iron.

From B. M., Milwaukee.—If "N. K. W.," Stoneboro, Pa., lives in a town where there is so much sulphuric acid derived from the coal used that tin or galvanized iron eave troughs and conductors will not last over two years, it is a question if sheet zinc would prove durable. Would it not be a good plan to use sheet copper for the purpose, even if it is somewhat expensive?

Soldering Aluminum.

From JOHN H. ROBERTS, Muncie, Pa.—Answering the inquiry of "D. L. W.," which appeared in *The Metal Worker* of June 15, regarding the soldering of aluminum, I desire to say that I have a solder and flux that will join aluminum to other metals or to itself, making a good durable joint. The process calls for no other tools than belong to any timer's set.

Tarred Paper Under Roofing Tin.

From EBERTS BROTHERS COMPANY, LIMITED, Detroit, Mich.—In reply to the inquiry of "A. S.," Paris, Ill., which appeared in *The Metal Worker* June 15, we would say that tarred paper will injure metal roofing. The best kind to use is red rosin sized or dry felt paper. This has been our experience.

The seventh statistical report of the Interstate Commerce Commission, which has just been submitted, covering the fiscal year 1894, shows the total railway mileage of the United States at that time to have been 178,708, an increase during the year of 2247 miles, as compared with an increase of 4897 miles in 1893. During the year 1570 locomotives and 30,389 cars were fitted with train brakes, and 1197 locomotives and 34,186 cars were fitted with automatic couplers. Nevertheless about 72 per cent. of the total equipment are still reported without these safety appliances. The law requires that all equipments shall be supplied with these appliances before June, 1898. The total number of railway employees on June 30, 1894, was 779,608, a decrease of 93,994, and less than in any year since 1890. The total amount of railway capital reported on June 30, 1894, was \$10,796,478,813, an increase of \$290,238,403. The gross earnings of the railroads for the year showed a decrease of \$147,390,077, or nearly 12 per cent. Railway employees killed during the year numbered 1823, and 23,422 were injured, as compared with 2727 killed and 31,729 injured in 1893. At the close of the period covered by the report, 102 roads, operating upward of 42,000 miles of line and representing about one quarter of the total railway capitalization were in the hands of receivers.

The United States Consul at Bahia, Brazil, reports that a coaling station, capable of storing 10,000 tons, is under way at that port. He also reports the manufacture of cotton to be in a flourishing condition there. One mill, which has 720 looms, is about to increase its capacity to about 2000 looms.

PLUMBING and GAS FITTING.

The Belmont Water Closet, with Seat Attachment.

The Dececo Company, 146 High street, Boston, are putting on the market a handsome, strong and hygienic

tact between the metal and the earthenware and to take up vibration in case the seat is dropped. This method of seating, it is claimed, gives the minimum amount of wood work and leaves the rear of the closet accessible for

The Belmont Water Closet with Seat Attachment.

combination water closet, illustrated herewith. The seat is attached directly to the closet by means of a bolt hinge which passes through heavy lugs of earthenware, into which has first been passed rubber sheaths to prevent con-

cleaning. This combination includes a perpendicular entrance of the flush pipe into the earthenware by means of a slip joint connection without offsets, and secures the full benefit of the "head" of water from the tank.

Wolff's Cross Bar Stop and Waste.

Illustrations are herewith given of the new stop and waste which is being manufactured by the L. Wolff Mfg. Company, 93 West Lake street, Chicago. In designing this new pattern, the manufacturers were actuated by a

*Wolff's Cross Bar Stop and Waste.—
Fig. 1.—Showing Cross Bar.*

desire to give the plumbing trade not merely a novelty but something possessing peculiar merits and advantages. They adopted, for instance, the

Fig. 2.—Showing Double Check.

plan of putting extra metal in the form of cross bars at right angles along the line of the center of the stop, as shown in Fig. 1, to give it great additional

Fig. 3.—Square Socket.

strength. The cross bar is a feature of the entire line, which covers designs for connecting with lead pipe, lead and iron pipe with one end threaded or iron pipe exclusively with both ends threaded. Another feature introduced

for the purpose of adding strength is a double check, Fig. 2, presenting a top view of the stop to show the manner in which the check is made. There would seem to be no danger whatever

Fig. 4.—Tee Handle.

of this check getting out of order or wearing so as to require care in shutting off or turning on the stop.

Sockets are furnished to enable any kind of a handle to be used. Illustrations of the sockets are given in Figs. 3, 4 and 5. These sockets, as will be seen, can easily be fastened to the

Fig. 5.—Gos Pipe Socket

shank of the stop. In addition, a lever handle can also be used, which is fastened directly to the shank. All the handles are interchangeable. The stop is also reversible, being easily changed from right to left or vice versa.

Would Not the Interests of the Master Plumbers be Served by an Agreement that They Should Not Handle Tools?*

BY JOHN J. FOY, ST. LOUIS.

We will assume for the sake of illustration that at the reading of this essay we are in some mythical city, and for convenience sake we shall christen it "El Dorado." We find the master plumbers enrolled in an organization whose principles embody "The Advancement of the Plumber's Art," "The Promotion of Social Intercourse Among its Members," and "Protection to its Members in Buying, in Selling, and in Competition." We also find the journeymen plumbers enrolled in an organization with principles embodying the vital ideas of the other, and insisting on a standard scale of wages being paid its members for their labor, that being the method of protection most easily applied to them in the sale of their labor. We will now assume that all master plumbers are paying their employees this standard scale of wages referred to. Thus from the point of view of both master and man, to use a more democratic and more fitting expression, "Employer and Employee," we have an ideal city, one in which the "Good" shepherds of the respective organizations have only to look to the welfare of their flocks from within, since there are no stray sheep outside. I have thus far observed a duality of form in reference to the organizations, because I desire our advanced thinkers and reformers to remember that complete satisfaction as to mechanical excellence or financial emolument cannot be attained without both the employer and employee have arrived at conclusions of mutual value to one as to the other.

* Presented at the Thirteenth Annual Convention of the National Association of Master Plumbers, held in Philadelphia, June 11-13.

THE IGNORANT JOURNEYMAN.

In treating the question proposed in an affirmative manner, which I do from purely conscientious motives, and from a sincere desire to elevate the calling to which I have devoted my life and talents, it will be necessary for me to severely censure an element in the ranks of journeymen plumbers—the element without whose existence the question herein treated would never have found birth. The balm I have to offer the honorable and worthy journeyman is that the production of that class I propose to censure is due to the class of employers whose workshop is a training school of ignorant youths, from motives of monetary greed, and who of necessity grow up into ignorant and unskilled men. And now to come nearer to my subject in its individual phase. Let us accompany one of these young men, who, after having served a haphazard apprenticeship of five or six years, finds himself forced, through the strength of organized labor, to become one of their members. His teachers in the intricacies of the craft have been usually boys or young men as ignorant or more ignorant than himself, and even granted that his master may have once been a representative mechanic, the methods of cheap construction adopted by those men have kept him from imparting any of his knowledge to his apprentice. He finds himself in the labor market, completely unprepared as to the value of his work as the more favored youth with the advantage of early education, of apprenticeship under a firm where his associates had been skilled mechanics and whose employers were proud of the character of their workmanship. His poor ability quickly becomes known, and he receives employment only at such times as the demand for labor is in temporary excess of the supply.

BECOMES A MASTER PLUMBER.

At the end of a year, or probably two, he realizes that the unsteadiness of his employment does not average in financial results little more than that of the poorest laborer, and it is then that he turns longingly to the position of "master plumber," feeling that he can surely secure sufficient work to keep himself employed, and to rid himself of the necessity of receiving more wages than he is capable as a mechanic of earning. Only too often we find him, though nominally a "master plumber," simply the employee of some general contractor or building speculator. He is a workman upon their buildings, putting up the material purchased with their money or credit, as a mere informant to their ideas of cheapness and appearance as the laxity of the plumbing inspector will admit of. He is unfair in competition with the employer who must pay for his labor. He is unfair to the workman who would have secured employment had the contract been secured by a legitimate firm; he is unfair to all classes of building trades and arts, since he is paying the way for the speculator and the miser to hire his labor direct from the masses to construct work according to his ideas of show and economy, and not of thoroughness and excellence; and lastly, as the precursor of such a system, not only in our own trade but in others, he becomes a menace to our modern civilization, to that progressive class of builders who have astonished the world, and who in a single century transformed American architecture in its every detail from the primitive log cabin of the colonist to the beautiful and highly welcomed the foreigner at the "White City" and that to-day adorn every city of our common country. There is a thrill of pride in the heart of every citizen at such glorious progress, and the man or men who would undo our work of care and sacrifice, who would lead us backward and not forward, should be thrust aside. It is a duty we owe not only to ourselves but to the good name of our country. He is the type of man whose existence in our midst has made necessary the question I am treating, and in writing of him I presume it has become evident that I am convinced the master plumber should not handle tools.*

WHEN HE MAY HANDLE TOOLS.

There are some circumstances where this rule may be honorably ignored, and to show just how and when it becomes necessary for me to treat of another type of master plumber, who is the direct opposite of the one already treated, we will refer to that type of journeyman plumber who after an honorable career as an employee develops the ambition to secure a footing in business life. This man will take pride in doing good work, in employing skilled labor and

in the general upbuilding of the trade. He feels that success in business life is incident always to "a survival of the fittest," hence his first efforts are to build up a reputation as a master mechanic equal to the one he possessed as an active workman. He has been a faithful member of his organization in the past, and his close communion with labor problems and his vigorous attitude toward the warmth of friendship and manhood they desire to foster make him good material in business life for his development into an honorable competitor for trade, a just adversary in debate and a loyal, honest friend to all who deserve his consideration. He is of the type who will strive to place our calling in the proudest niche of mechanical arts. He will not employ unskilled labor; will not use poor material where better has been specified, and he will not lie about nor traduce the character of his competitor. He started at the lowest rung of the ladder and received his education in the school of skilled and intelligent labor, and her graduates are always men. This man may occasionally take off his coat to perform some unusually difficult task, to teach some less skilled brother some simple "trick of the trade," or to map out a system of work for his employees' benefit, or more often of the make "an unusual argument" which seems to be the spice of the practical plumber's life. For these digressions we can all forgive him, since they promote the general good. They result from his natural pride as a man of practical ability, and since it is an honest pride let us join in it with him and wish him an ever successful career a hearty god-speed. If my words have produced, as Bill Nye would say, a "slight commotion in your think tanks," then they have not been unproductive of good. One thought borrows another, and every intelligent mind will see that a solution of the apprentice problem is really the solution of all the ills incident to the plumbing trade of to-day. Rid ourselves of this incompetent and ignorant mechanic by governing the class from which he is produced and better days will quickly dawn for every one connected with the plumbing trade. Remember, there is nothing impossible to those who will.

"All are Architects of Fate,
Building up the walls of time;
Some with massive deeds and great,
Some with ornaments of rhyme.

"For the structure that we raise
Time is with material filled;
Our to-days and yesterdays
Are the blocks with which we build."
— Longfellow.

New State Association.

A State Association of Inspectors of Plumbers has been organized in Worcester, Mass. These inspectors met at the office of the local Board of Health, and adjourned to the Washington Club House at the lake: W. A. Ford of Cambridge, Philip Connealy of Watertown, M. B. Coleman of Newton, Frank Tower of Springfield, D. S. Callahan of Marlboro, John F. Bresnahan of Fitchburg, Joseph A. Murray of Holyoke, A. L. Moody of Waltham, D. S. Green of Somerville, J. H. Lynch of Fall River, Wm. Connors of Lowell, G. A. Andrews of Medford, J. H. Cullington of Lawrence, Geo. Chamberlain of Lynn, John F. McCartney and J. F. Hurley of Worcester. Dinner was served by the Washington Club chef, after which an organization was formed by the choice of these officers: President, Philip Connealy of Watertown; secretary, W. A. Ford of Cambridge; treasurer, J. F. McCartney of Worcester. A Committee on Constitution and By-Laws was chosen, consisting of J. F. McCartney of Worcester, Joseph A. Murray of Holyoke, D. F. Callahan of Marlboro and A. L. Moody of Waltham. Letters were received from inspectors in various cities and towns, who were unable to attend the meeting, but who indorsed the movement for organizing an association. The meeting adjourned to Wednesday, September 4, at Boston, when action will be taken on the adoption of a constitution and by-laws.

To What Extent May Municipal Legislation be Relied upon to Enhance the Standing of Master Plumbers? Is it not, in some cases, a Bolster and Endorsement of the Unworthy?*

BY JOHN L. E. FIRMIN, SAN FRANCISCO.

It is true that the prime, moving cause of our organization was the betterment of our condition in dollars and cents; but it is also true that immediately upon the consideration of our environments we became convinced that to bring the desired result about we must take strong and active steps toward elevating the standard of practical sanitation. We found that our business had gradually become so demoralized that, aside from a few favored representatives, we were conducting our affairs without system, scale, gauge or rule; for instance, we were acquainted with the principle of sanitary plumbing; in a measure we understood the scheme of ventilation, &c., but in the general application of these principles we stood almost at zero. For the public had not been taught the benefit of sanitary plumbing. Secondly, the ruling conditions and customs placed in the hands of the architect all these powers of "luxury, favoritism, and even competition" under which, possibly, we now suffer, but with this difference, that then the abuse was carried to a much greater degree. I do not say this with a view to cast reflections upon architects, as such, any more than I do upon plumbers as plumbers; both became corrupted, and that to such an extent that when we figured upon plans and specifications of certain jobs each of us would probably figure upon a basis of not what we should do, but upon what we could avoid doing. In other terms, every condition and surrounding favored dishonesty, favored the man least troubled with conscience, thus thrusting honesty into the background. As above stated, we readily discovered the needs of the hour, among which it seemed to us was the creating of a standard, or, as a scientist might term it, a "unit." We had no starting point, no gauge, no rule, and so we created the plumbing laws.

PLUMBING LAWS.

Immediately we found—what? That in a great measure they removed from a certain portion of our work a feeling of ambiguity; for instance, placing our rough work within tolerably well defined lines, and that in a lesser degree they influenced the general tone of specifications. In fact, it seemed generally admitted we had taken a proper step, but in time a danger developed, a great danger both to ourselves and the general public. That danger was and is overconfidence upon the part of the architect and the general public, on the "cure-all-ism" of the plumbing laws. We found that the public had come to rely in a dangerous degree upon the plumbing laws to supply not only the basis but the whole superstructure of modern sanitary plumbing. Practically they ignored the individual efforts of the enlightened and progressive plumber and threw their whole faith upon the law; therein they injured both themselves and us. It is our duty to educate the public to thoroughly understand the underlying principles that the plumbing laws in themselves are good just as far as they go and no further. "There are many ways of killing a cat beside choking him with butter," and the law may be obeyed while at the same time it is practically avoided and violated. No matter how impartial, honest and competent an inspector may be, in the very nature of things there are one hundred and one ways of "putting his eyes out." The public should remember that the majority of laws are framed with a view of preventing the straight going crooked and straightening the crooked, and that upon the application of law the crooked immediately set about to devise means to avoid the penalties of violation; on the other hand, honesty complies, not only with the letter, but with the spirit of the law. Plainly, then, portions of our craftsmen who are endeavoring to be just to their fellow men; that portion who have fully given their best thought in devising improved methods of practical sanitation; that portion of us who can point to

the improved standard of plumbing to-day as part of our labors, have not been rewarded in anything like a just ratio, and I might even say that in an every day dollar and cents view have not directly benefited at all; still as a whole we have. For example, I would point to the many well conducted and appointed plumbing establishments which you may find scattered all over the country, as against the rat hole cellar of a shop which even now we too often see.

BENEFITS OF HONEST METHODS.

It cannot be that any great portion of the well appointed shops are the result of dishonest methods—I cannot think it—but we know they have developed only since our organization and the adoption of plumbing laws. The danger lies—both to the public and ourselves as business men—that the public have come to believe that all plumbers, by virtue of the law's operation, are compelled to produce equal and certain results, and that if they have a certain piece of work to be performed it will make no difference whether they give the job to Jones or Brown, because in either case the law steps in and demands the work shall be performed in a certain manner. Therein they fall into error, injuring themselves as well as the honest plumber; they remove the incentive to progression and honesty.

Be ye ever so learned, a judge who reads and administers the law with favoritism is the essence of corruption. A wise and impar-

into the realms of that abstract philosophy, political economy, it might be well for us to remind ourselves of the fact that we, as part of the people, are suffering from—we know not what, but that the ailment is called "general depression," and that if we were wise enough to prescribe a true remedy for that complaint we would at the same time lift a country out of a "slough of despond."

Let us not forget that while we owe a duty to ourselves and families, and that in justice to them we should faithfully labor to improve their and our condition in life, that we owe a still higher allegiance to civilization.

Stephenson's Portable Foot Bath.

The accompanying cut illustrates the portable foot bath made by C. H. Stephenson, Lynn, Mass. This bath is placed inside the bathtub beneath the faucets, connecting automatically with bathtub waste, having chain and plug or automatic shut off attached. The water is drawn into the foot bath from the bathtub faucets and emptied through the waste of same without the water running into the bathtub. The foot bath is made of tin or copper, enameled, and weighs 6 pounds, is 16½

Stephenson's Portable Foot Bath.

tial judge is one of the great factors of civilization. So with our inspectors! And while I have no reason to reflect upon the inspectors of the country, and more especially of this city, still, in the very nature of things there must be dishonest inspectors; then, indeed, are conditions bad for the honest plumber, and there is increased need of care in the choice of your plumbers.

THE FUTURE OF PLUMBING LAWS.

The plumbing laws are the result of the labors of master and journeyman associations and of the sanitary press—an evolution of these combined forces. They are the concrete of years of mental and physical expenditure. They have come to stay; they will not retrograde. We could not, did we so desire, now remove them. They have created a demand for an enormously increased variety and volume of appliances, consequently creating a market for labor. They have improved our craftsmen and tradesmen as such; they have added elegance, comfort and health to modern civilization and society; they are the mainstay of our sanitary press; but they have been relied upon too much by the public and, in a great degree, they have failed to reward their creators.

Whether as a whole they have proved beneficial to plumbers may perhaps be better judged by comparison with communities who are conducting their affairs under conditions of an entire lack of regulating laws, where, as I may say, the state of "Anarchy of Plumbing" exists. Do you here find the relative position of our craft better or worse than our own? From examples I know of as now existing I assert without hesitation that though our condition is bad, that under a similar condition of anarchy it might be very much worse. Without going

inches long, 14 inches wide and 8 inches deep, with 3-inch metal legs that can be folded when used in a bath tub or extended when used otherwise. When used in a tub it rests on rubber corners. It is referred to as extremely convenient in a sick room, as it can be carried to a bedside. It also can be used for taking a mustard foot bath and as a baby's bath.

A STRIKE of the sanitary ware potters at Trenton, N. J., is considered likely to occur before long. Early in the present week the sanitary potteries were closed and the workmen met in conference to formulate a new scale of prices to submit to their employers. It is understood that the men will ask for an increase of pay ranging from 10 to 40 per cent., according to the class of work on which they are engaged. This would make the scale about what it was in April last, when the organized potters voluntarily reduced the scale to meet the prices paid the non-union men. Since that time the non-union men have joined the union. It is understood to be the determination of the men to go on strike if the master potters do not accede to their demands. It is not yet determined when the men will ask to have the new scale go into effect. Dispatches from the West indicate that the operative sanitary ware potters in that section will be governed by the scale eventually agreed upon at Trenton. The number of men involved

* Presented at the Thirteenth Annual Convention of the National Association of Master Plumbers held in Philadelphia June 11-13.

in the Trenton potteries is about 500, or 90 per cent. of the whole number employed in the sanitary ware industry in that place.

Unity.*

BY EDWARD E. SHUSTER, ST. LOUIS.

Should not the master plumber decline to bid as a sub-contractor? Should he not insist that the plumbing be reserved from the general contract?

To my mind no more timely and appropriate question could have been proposed for discussion by the Essay Committee than the above. It is a question which should occupy the mind of every member of this association, as it is of so much importance, especially at the present time, that it would be gross neglect on our part should we permit matters regarding this question to be carried further on if we have any means at hand by which the evil could be remedied.

THE EVILS OF SUBLETTING.

I dare say the subletting of plumbing work by irresponsible builders is one of the greatest evils that have befallen our trade, and should be eradicated at the earliest possible moment. Some one might say, how are you going to stop it? My answer would be, very easily. All that is necessary for us to do is to stand together, one and all, and make an earnest agreement between us by which we positively refuse to bid for any one except the architect or owner. This may not seem to be such an easy matter, but it we give it the necessary attention which it really deserves I haven't the least doubt that it could be easily accomplished. When taking into consideration the good that would result from such an action we come to the conclusion that it would be of such great benefit to each and every one of us that we should do everything in our power to carry it through. Take, for instance, an architect who has drawn plans for a fine job of plumbing in a good residence, and who is really anxious to see some good, responsible master plumber receive the contract for its execution, who, upon approaching the owner with the suggestion to leave the plumbing out of the general contract usually meets with the owner's disapproval. Why? Is it because the owner is not particular whether he gets a good job of plumbing or not? You will find in almost every instance that he expects a first-class job, but he has been informed by some irresponsible builder, who does not care whether he gets a plumber to do a good job or not—so long as he does it cheap—that if he lets the plumbing along with the general contract he can save some money and get just as good a job as if he would let it separately, because all the work would have to be done under the supervision of the plumbing inspector, and that would give the plumber no chance to do a bad job. The owner naturally supposes such to be the case, and from a desire to save all he can on the building is prompted to turn it into his hands to give to whom he sees fit.

The architect not being in a position to demand from the owner that he pay more than he can get the work done for under the builder's contract, has no way to demonstrate to him that the money additional for a really first-class job would be money well spent, and as the owner does not seem to be very particular as to who really does the work, seeing a chance to relieve himself of a portion of the responsibility he would otherwise have to bear, the architect yields and the job goes to the cheap man who works for the builder.

THE CHEAP MAN WHO WORKS FOR THE BUILDER.

Let me try now to define what and who I mean when I speak of the cheap man who works for the builder? I suppose I need hardly mention it and you know already who I mean. I mean every one who is today engaged in the plumbing business and who is compelled to go out among these so-called builders and seek employment. And why do we take sub-contracts from them, and take them at a price wholly out of proportion to the amount of work to be done?

I believe I can explain it. It is the result of our giving estimates to every one asking for them, regardless of who they may be or whether they are responsible or not. I even know of builders receiving bids from

plumbers totally unknown to them and whom they have never asked to bid. This is a practice which should by all means be stopped. If we cannot stop bidding for builders we can at least restrain ourselves to bid only when asked to do so.

What are the majority of "builders" of to-day? Are they not men who will come to us, after we have submitted our bid, and tell us that Mr. So-and-so is so many dollars cheaper than we are and if we can meet that price we can have the job? Gentlemen, you all know they will, and if we meet the price and take the job we will be lucky if we come out even and do not lose money on it. Then why should we not try to confine our bids to architects alone? Why should we bid for people who use every means in their power to cut our prices and then take chances on getting our pay when we are finished?

I am well aware that there are honorable and upright men among the builders whom we must respect and to whom I would submit my bid as willingly as I would to

and submit our bid, and will not be compelled to send bids to ten or twelve builders who are bidding on the same job.

I do not wish to be understood as though I had no faith in plumbing inspectors and that their supervision of the work would not be of any benefit to the owner. On the contrary, I am confident that when the inspector does his duty and insists on the work being done properly it will be productive of much good, but there are a great many things necessary to do a first-class job which do not come under his supervision and which he is not responsible for, and yet they are of so much importance that they cannot be omitted.

And therefore we should always insist on getting the necessary remuneration for a job of work that will enable us to furnish all these necessities and do the work not only to the satisfaction of the owner or architects, but also to our own satisfaction, so that we may have a clear conscience when we get through with our work, knowing that we have done everything in

Morrison's Bath Fixture.

an owner or architect, knowing full well that if I was the lowest bidder I would be awarded the job. Yet I believe that in submitting our bids only to architects we would benefit them and would meet with their approval, as they are not anxious to sublet the plumbing and would rather have it off their hands. The only one who wants it all included is the one who will peddle it out, and who will sell out at any time if he can make a \$3 bill by the operation.

SEND BIDS TO THE ARCHITECT.

Shall we humble ourselves to these people any longer and give them a chance to still further cut down our prices? No, gentlemen, not if we know ourselves. We have the remedy in our own hands. Why not make use of it. Why not submit our bids only to architects. If we do that the natural result will be that the "peddler, or skin builder," as I name him, will be knocked out, and some of us will get the job, and owing to the fact that we would get a price consistent with the quality of the work would be enabled to do it right. And now I ask you, gentlemen, would it not be better for us all if we got only work of this kind? Therefore, gentlemen, let us come together, make an agreement and live up to it, and we will see the beginning of a new era in the plumbing trade. Every one will be benefited alike, and bidding will be very much simplified, inasmuch as it will be the saving of time and money for us if we can go to the architect, figure our work

our power to do what is right and have omitted nothing.

Morrison's Bath Fixture.

The accompanying illustration shows a portion of a bathtub with Morrison's bath fixture attached, a specialty that has been brought out by the A. Y. McDonald Company, 164 Lake street, Chicago, Ill. The fixture includes standing waste, low down bell or silent supply and top supply, which can be used for shower. It is particularly noted that with this fixture provision is made for both top and bottom supply, either of which can be used at will. There are no solid or screwed joints, as the entire fixture is put together by slip joints. It will fit any tub that has not been drilled for cock or overflow, and can, it is said, be attached in 15 minutes. Compression cocks are used, thus doing away with air chambers, and the seats of the compression cocks are removable for repairs.

ANGUS MCINNIS and CHARLES E. THORNE have formed a partnership for the purpose of carrying on a general

* Presented at the Thirteenth Annual Convention of the National Association of Master Plumbers, held in Philadelphia June 11-13.

plumbing, gas fitting, steam, hot water and hot air heating business in Charlottetown, P. E. I.

New Regulator for the Welsbach Lamp and Other Gas Burners.

The rapid steps the Welsbach lamp has taken in the gas line lends interest to any device to be used with it. The Davis & Stevens Mfg. Company of Seneca Falls, N. Y., have placed on the market a little regulator to be used with the Welsbach, which they claim will considerably lengthen the life of the mantle, as a steady pressure is assured.

This regulator, a cut of which is shown herewith, has an automatic ac-

New Regulator for the Welsbach Lamp and Other Gas Burners.

tion, can be applied to the Argand, Morey or any gas lamp or burner, and is claimed to save at least 25 per cent. of the consumer's gas bill, and is sold at a very low price.

TRAPS AND VENTS.

DETROIT gains an excellent citizen for the coming year in W. E. Crosby, executive clerk of the National Association of Master Plumbers, who will make his headquarters with the National President, James Meathe. The trade press have found Mr. Crosby a very straightforward and courteous official, and wish him success in his labors under the new administration. With the plumbers of the oratorical and statesman type, as well as with the quiet and hustling sanitary tradesmen, he is well known and highly esteemed.

THE WORKS of Randolph & Clowes, Waterbury, Conn., were partially destroyed by fire Thursday morning of this week. We are advised by them, however, that the damage will cause little or no delay in filling orders of their customers.

THE SANITARY WARE POTTERIES at Trenton, N. J., which were idle for some days last week, were again put into operation on Tuesday, the manufacturers and the workmen having agreed on a new scale of wages. This scale gives the operatives an advance

rating from 10 to 40 per cent. over the wages recently current. The greatest advance is made on staple goods. The workmen, among other demands, asked that a shop committee should be appointed by themselves to fix the prices to be paid for all new shapes. This the pottery manufacturers were unwilling to concede, arguing that it would result in allowing the workmen to run the business.

JAMES MEATHE, Detroit, Mich., the newly elected president of the National Association of Master Plumbers, is second vice-president of the National Association of Builders.

HERMAN A. PHILLIPS, the permit clerk of the Water Department, Chicago, Ill., has turned over the names of 150 plumbers who are delinquent in taking out their licenses to Chief Badenoch. All of these made application for permits in January last, but have failed to pay the required license fee of \$25. They are liable to a fine of not less than \$10 nor more than \$100 for failure to pay, and the names were turned over to the Police Department in order that warrants might be taken out and the delinquents brought into court.

THE SIMPSON PLUMBING COMPANY have been incorporated at Chicago, with a capital of \$3500, by David Klotter, John W. Simpson and Josephine Klotter.

THE PLUMBING SUPPLY HOUSE of F. J. Letcher & Co., 308 Grove street, Jersey City, N. J., had their safe opened and robbed last week.

FRANK A. STANLEY has removed his plumbing establishment to the Simmons Block on Second avenue and Walnut street, Pine Bluff, Ark.

N. E. WALSH has removed his plumbing business into new quarters at 520 West Locust street, Des Moines, Iowa. Mr. Walsh was engaged in the plumbing and steam heating business in Des Moines 20 years ago and for nine years he conducted an extensive business. In 1882 he moved out to Helena, Mont., where he was engaged in his old business for eight years. He returned to Des Moines two years ago, and has engaged the patronage of many of his old customers since, and has made many new acquaintances. He is now prepared to do all work in the line of plumbing, steam and water heating.

JAMES M. CLANCY, Danvers, Mass., will occupy the lower part of the building recently vacated by Caskin & O'Connell for his plumbing business.

WOOD & McDONOUGH have opened a plumbing establishment on the corner of Lafayette avenue and Tenth street, Mountsville, W. Va.

A FIRE which visited the Pfau Plumbers' Supply Company, 138 Hunt street, Cincinnati, Ohio, on June 15, caused damage amounting to \$3000.

SANITARY INSPECTOR SULLIVAN of the New York Health Department recently made a report on the condition of the Custom House, in Wall street, which has been forwarded by the Collector of the Customs to Washington. In his report Inspector Sullivan condemns the plumbing and ventilation of the building. He states that repairs to the existing system are impossible, and that there must be renewals. The inspection was made because of frequent complaints of offensive smells made by persons employed in the building and by visitors whose business took them there. The health of the Custom House employees, too, is said to have suffered to a large extent.

KIRTLEY BROS., Kansas City, Mo., are sending to the trade a neatly printed pamphlet fully describing their

improved system of water works operated by compressed air. This system is known under the name of the Domestic water service, and is referred to as being practicable, durable and simple. This system is principally intended for country homes, business and public houses which are distant from water mains.

W. H. CLAY, who has been connected with the Barlow Bros. Company for the last 15 years, has opened a plumbing establishment at 84 South Main street, Waterbury, Conn. He will also engage in hot water heating and general jobbing.

C. SULLIVAN, Newark, N. J., has returned from the convalescence laden with honors. He is State Vice-President of the National Association of Master Plumbers for New Jersey. He is also State Vice-President of the Steam and Hot Water Fitters' Association of the United States for New Jersey, and is Chairman of the Protection Committee of the Newark Association of Master Plumbers. Mr. Sullivan carries his honors easily and is an efficient worker.

THE HOLLY BATH TUB COMPANY, Holly, Mich., are issuing a four-page circular showing the Day portable and folding bathtubs with instantaneous bath heaters which they are manufacturing. The illustration on the first page shows the bathtub in a horizontal position ready for use, with the water heater arranged in the case of the bathtub. The second illustration shows the tub closed as it is when not in use. The illustration on the third page shows the sheet metal tub with the burners for heating it arranged on the under side; and it is said that a bath may be heated in from 7 to 15 minutes. The last page shows their instantaneous heater arranged against the wall, adapted for use in connection with any character of bathtub. The heaters are adapted for use with gasoline, coal oil and either artificial or natural gas. The illustrations show that the goods are attractive in design, and it is claimed that they are both durable and efficient in use. Dealers in suburban districts can doubtless bring these goods to the notice of their customers with profit.

JAMIESON & MCKINNEY, Ithaca, N. Y., are removing the plumbing and heating apparatus from the Noble Building preparatory to its being taken down to make room for the Trust Company's new structure.

AMONG the plumbing establishments recently started in Chicago can be mentioned the following: Butler Bros., 5214 Lake avenue; A. Mourant, 345 Forty-third street; Charles P. Hagerty, 1120 George street; Kingston & Curran, 250 Centre avenue; Ward & McMahon, 2859 State street.

JOSEPH ALLARD, Southbridge, R. I., will soon open a plumber's shop in the Deleahanty Block.

W. H. HITCHCOCK, who has been in the plumbing and tin business at Palmer, Mass., is soon to remove his business to Springfield.

THE AMERICAN GAS REDUCTION COMPANY of New York City have been incorporated, with a capital of \$35,000, to manufacture, sell and rent automatic gas saving regulators. The directors named are Richard B. Schoonmaker and Louis S. Fries of New York City and J. B. Turner of Elizabeth, N. J.

LEE PATTERSON, senior member of the plumbing firm of Patterson & McFadden, Pittsburgh, Pa., died suddenly at Mt. Clemens, Pa., on June 10. Mr. Patterson had gone to Mt. Clemens for

the benefit of his health, but it was not expected that his illness would take so sudden and serious a turn.

THE AUTOMATIC SEWER TRAP COMPANY of New York City have been incorporated under the laws of the State of New York, with a capital of \$25,000, to manufacture sewer traps. The directors are Lewis W. Rope, Garrett C. Hallenbake of Brooklyn, and Walter West of New York.

LERCH & SPANG, 344 Roscoe boulevard, and Grannan & Slement, 663 West Madison street, have recently started plumbing establishments in Chicago.

The Young Men's Institute, New York.

The tenth annual report of the Young Men's Institute, New York City, located at 222-224 Bowery, has just been published. A feature of the work of this institute which is interesting to our readers is the educational department, which has run a very successful course during the past season. The course of study followed in the evening classes held at the institute include such elementary subjects as come under the heads of English grammar, penmanship and arithmetic. There are also, however, trade classes, in which are taught plumbing, mechanical and free-hand drawing, steam engineering, electricity and carriage drafting. In all, there were, in the past season, 12 classes, held every night in the week except Sunday. The total enrollment of scholars was 669 in 1894, as compared with 617 in 1893. The percentage of regular attendance on the part of these scholars has been 78. In the fall of 1894, a class was opened in sanitary plumbing, with Prof. James Temant as instructor. The enrollment in this class was only 9; but, as the class becomes better known, the directors of the institute expect that it will be more appreciated and that the numbers will considerably increase. An excellent display of work done by the pupils in the various classes was made in the building of the institute last month, when the annual distribution of prizes and certificates was held. A display of the pupils' work was also made at the New York State convention of the Y. M. C. A., at Jamestown, and later at the international convention at Cedar Rapids, Iowa. From there the exhibit was taken by the Educational Secretary of the International Committee to the larger associations all over the country, where it has done much to stimulate interest in special work for the mechanical and artisan classes by the members of the Y. M. C. A. The report shows that the institute, situated in the heart of the labor district of New York City, is reaching and benefiting large numbers of young mechanics and artisans who might not otherwise be able to secure the educational advantages which they find in this establishment.

The sanitary plumbing classes are held every Wednesday and Friday, from 7.30 to 9.30 p.m. The course of

instruction is divided into two terms, the coming autumn term being from October 2 to December 29, 1895, and the winter term from January 2, to April 23, 1896. Similarly the other classes are held on two evenings every week. Any young man of moral character between 17 and 35 years of age, may take advantage of these classes upon paying a membership fee of \$4, and an additional class fee of 50 cents per month for steam engineering, electricity, and plumbing. Other classes are 50 cents per term, payable in advance.

Exhibition of Acetylene in Domestic Use.

An exhibition given recently in the house of Edward C. Napheys, 2024 North Broad street, Philadelphia, of the domestic uses of the new gas acetylene, is thus described in the *Public Ledger* of that city: Acetylene is a product of a carbide which is made from lime and carbon (in the form of coal dust), reduced in an electric furnace. The carbide, exposed to moisture, evolves a gas very rich in carbon, which, in the process used, is liquefied, and, being furnished in this form, supplies gas, which may be used in the ordinary way, but with much smaller burners than are commonly used. What the guests saw was a cylinder in the cellar 3 or 4 feet long and about 4 inches in diameter, containing about 50 cubic feet of the gas under considerable pressure. It held what was said to be the equivalent of 1000 cubic feet of city gas. This cylinder was connected with the pipe system of the house, the city gas being cut off. A large number of 1-foot burners in the various rooms on the upper floors were lighted, and the whole house appeared to be brilliantly illuminated, although the number of burners was actually less than would ordinarily be employed.

In the dining room there was a cluster of six or eight, in the sitting room three made the apartment as light as day, and in the parlor four electric lights "paled their ineffectual fires" before four gas burners supplied with acetylene. The flame at the burners was not much larger than the blue part of a batwing burner flame supplied with city gas, but it was intensely white, and the blue part was almost indistinguishable.

There was no doubt about the illuminating value of acetylene and the guests were informed by Joseph A. Vincent that the carbide could be produced at such low cost as to compete with city gas at 16 cents per 1000 cubic feet. The calculation, he said, was the result of tests made by distinguished scientists under unfavorable conditions. The gas could be furnished to consumers from a central station or served in cylinders to isolated houses.

The new battery of pneumatic guns at Fort Winfield Scott, on the Presidio Reservation, intended for the protection of the port of San Francisco, Cal., is now practically completed, but will not be ready for turning over to the War Department until the fall on account of a difficulty having been experienced in obtaining an adequate water supply. For this purpose a powerful steam pumping equipment will have to be put up, as not a drop of water has been found on the site of the battery. The pipes will have to

be run half a mile to tap the nearest conduit, after which pumps must be used to force the water up to the bluff. This battery is composed of three 15-inch guns, and is so situated as to command the whole of the channel leading up to San Francisco.

A dispatch from Washington, D. C., states that, from information received at the Navy Department, there is no doubt that active work will be resumed at the Washington Navy Yard after July 1. On that date the Bethlehem Iron Company will begin delivering the steel gun forgings to be manufactured into naval ordnance. The contract calls for the delivery of all the forgings within 119 days after July 1. The contract is for 10 sets of forgings for 4 inch guns and 20 sets for 5 inch guns. This will give sufficient work to keep the yard busy for some time to come.

The Pennsylvania railroad is credited with the intention of purchasing upward of 100,000 tons of steel rails for use on its system this year. Their tracks are to be put in complete repair, and it is proposed to make, ultimately, a four-track line between Jersey City and Pittsburgh. A number of important alterations are also contemplated in the changing of grades and improving alignments.

The May report of exports, just published by the Treasury Department, shows increases of over \$1,000,000 respectively in the value of breadstuffs, mineral oils and cotton exported last month as compared with May, 1894. On the other hand, provisions exported show a falling off of \$3,000,000 during the month. The total decreases for the 11 months ending May 31, as compared with the same period of last year, were \$52,666,332 in breadstuffs, \$8,714,190 in provisions, \$3,861,971 in mineral oils and \$3,755,890 in cotton.

The new American line steamship "St. Louis" made an average speed of 18.37 knots on her maiden trip to Southampton. As the vessel was not pushed in order to obtain any high rate of speed, and considering the fact that the voyage was accomplished without the slightest hitch of any kind, her performance is regarded as eminently satisfactory.

A Chicago dispatch states that a number of the smaller telephone companies, which have been infringing on the Berliner patents since the decision two years ago declaring these patents void, will organize a national association for the purpose of fighting the Bell Telephone Company in and out of the courts, since that concern have been granted a monopoly of the Berliner patent on appeal.

George H. Murphy, commercial agent of the United States at Luxembourg, Germany, reports to the Department of State that a decree has been issued by the German Minister of Public Works discontinuing wherever practicable the use of petroleum at railway stations, in consequence of the rise in the price of American oil.

The Rockefellers are reported to have bought a large section of the town of West Seattle, Wash., including harbor frontage, for the sum of \$1,000,000 in cash.

ROOFING AND CORNICE.

Cook's Expansion Bolt.

The Coburn Trolley Track Mfg. Company, Holyoke, Mass., for whom the Henry B. Newhall Company, 105 Chambers street, New York, are agents, are putting on the market the expansion

Cook's Expansion Bolt.—Fig 1.—Composition Metal Socket.

bolt shown in the accompanying cuts. This bolt, it is mentioned, has been received by cornice makers and sheet metal workers with special favor for fastening their work to brick buildings. In use, a hole is drilled in a brick wall large enough to drive in the composition metal socket shown in Fig. 1. Fig. 2, a cross section, is shown after it has been driven into the hole. Fig. 3 shows the bolt screwed into the socket, and the bolt being larger in diameter

Fig. 2.—Cross Section of Socket in Wall.

than the hole in the socket it forcibly expands the metal into the irregular surface of the hole drilled in the mason work, thereby gaining a very firm and secure fastening. It has been used in connection with signs, fire doors, marble work, balconies and fire escapes with very satisfactory results. The company are now manufacturing a gutter hanger to be used in connection with this socket. The gutter hanger

Fig. 3.—Sectional View of the Socket in the Wall with Lag Screw Inserted.

will have a square shank which will be serrated irregularly on the edges, so that after the socket has been expanded the serrations will prevent the hanger from being withdrawn. A similar device will be made for supporting conductor pipe.

Pattern for Base of an Oriel Window.

From A. W. S., Bloomington, Ill.—I inclose a tracing of a base of galvanized iron for an oriel window. I do not find anything in "The Metal Worker Pat-

tern Book" which answers my purpose, and I would therefore ask if some one will give the method of developing the pattern for that shape. The top half is in three pieces and the bottom half in two pieces. I have executed the job and it passed inspection, but it does not

Pattern for Base of an Oriel Window.

suit me at all, and I think if I can get started right I can improve on my "first offense."

Note.—From the sketch submitted by our correspondent we have prepared the engraving presented herewith. It represents an elevation of the base, and at

sketch are those governing the cutting of curved moldings. This is a matter depending upon the judgment of the workman in determining what flare or radius can best be hammered or raised into the profile desired rather than upon mathematical rules. As our correspondent intimates, such a profile can be formed in any number of pieces according to the size of the base in question and the convenience of the workman doing the job.

FLASHINGS.

THE KANSAS CITY METAL ROOFING & CORRUGATING COMPANY, Kansas City, Mo., report an excellent demand for the goods carried by them, and also state that prices are rapidly advancing. They are urging their customers to place their orders early, as they do not think the prices will remain as low as

at present quoted. Among the contracts recently secured by them they mention new roofing for the Union Elevator, Kansas City; also large quantities of roofing for the Sylvia Milling Company, Sylvia, Kan.; McCune Roller Mills, McCune, Kan.; Neodesha Roller Mills, Neodesha, Kan.; Chickasha Milling Company, Chickasha, I. T.; Black Rock Lumber & Cooperage Company, Black Rock, Ark.; and Wellington Star Rolling Mill, Wellington, Mo.

THE LAWRENCE LETTS ELBOW COMPANY, Waverly, N. Y., issue a folded circular calling attention to their O G one piece plain round and corrugated conductor and stove pipe elbows. The folder gives prices of the various sizes and styles of elbows, which are likewise illustrated, and reference is made to their advantages.

THE JEWETT CARBONIZED FELT COMPANY of New York City, have been incorporated, with a capital of \$50,000, to manufacture and sell sheathing papers, roofings, &c. The directors are: Wm. G. Winans and M. H. Winans of New York City, H. H. Jewett of Chatham, N. J., J. A. Smith of Newark, N. J., and Wm. E. Mountfort of Brooklyn.

the right a section showing a profile of the molding which is to be carried around the curve shown in the plan herewith. The only rules governing the cutting of patterns for such forms as are called for by the correspondent's

TIN PLATES.

The Tin Plate Scale.

A conference was held in Pittsburgh, on Wednesday, the 19th inst., at 10 a.m., between the Conference Committee of the Association of Iron and Steel Sheet Manufacturers and the Amalgamated Association, at which the new scale governing wages in rolling mills for the year ending June 30, 1896, was presented. We present below extracts relating to the tin plate scale. The memorandum of agreement is the same as in the old scale, with the exception that a new clause, No. 6, has been added, which reads as follows:

"We hereby agree to supply the undersigned company with skilled workmen within a reasonable time, when desired, to operate their works in the departments governed by rates of wages herein contained."

In tin and black plate mills there is no change down to Nos. 21 and 24. The following table gives the changes now proposed:

Gauges.	Rolling steel, 2240 lbs.	Doubling.	Heat-ing.	Shear-ing.
Nos.				
21 to 24.....	\$1.07	\$1.86	\$1.63	\$1.59
25 to 26.....	4.57	2.07	1.88	1.71
27, 28.....	4.63	2.21	2.05	1.71
29, 30.....	5.39	2.70	2.48	1.76
31.....	5.40	2.84	2.66	1.78
32.....	5.63	2.97	2.79	1.88
33.....	5.99	3.13	2.88	1.98
34.....	6.64	3.33	3.15	2.20
35.....	6.97	3.52	3.34	2.39
36.....	7.45	3.80	3.46	2.46
37.....	7.52	3.65	3.52	2.49
38.....	7.60	3.72	3.58	2.52

An entire new scale for mills rolling black plate for tinning purposes only has been added and is as follows:

Gauge. No.	Rolling.	Doubling.	Heat-ing.	Shear-ing.
21 to 24.....	3.96	1.86	1.63	1.52
25, 26.....	4.00	1.66	1.69	1.52
27, 28.....	4.10	1.96	1.82	1.52
29, 30.....	4.50	2.36	2.17	1.54
31.....	4.59	2.48	2.34	1.56
32.....	4.80	2.60	2.44	1.65
33.....	5.09	2.74	2.52	1.73
34.....	5.64	2.91	2.76	1.93
35.....	5.92	3.08	2.92	2.01
36.....	6.32	3.15	3.03	2.15
37.....	6.39	3.19	3.08	2.18
38.....	6.46	3.26	3.13	2.21

In the foot notes No. 1 is unchanged, and No. 2 has been changed to read as follows: "Shesman on modern squaring shears to receive \$1 per ton. This clause applies only for shearing tinplate." In the extras three foot notes, Nos. 9, 10 and 11, have been added, reading as follows: No. 9, "Catchers on tin and black plate mills to receive 23 per cent. of rollers' statement." No. 10, "When plates are rolled lighter than the gauge represented, the mean weight between that and the next lighter gauge shall be the dividing line between the gauges." No. 11, "Eight hours shall be a day's work on tin and black plate mills." The limit of output is the same as in the old scale.

A new scale of prices for Morewood stacks has been added, as follows: Coke,

tinning 11 cents, washing 11 cents, catching 4 cents, assorting 4 cents. Best coke, 12, 12, 4 and 4, respectively. Charcoal, 12, 12, 4 and 4, respectively. Double rolling, 14, 14, 5 and 4 respectively. Heavy coating, 12, 12, 4 and 4 respectively. O'd style, 15, 15, 5 and 4. Foot notes to this new scale have been added as follows: "Standard: A box of 14 x 20, containing 112 sheets, equal to 81,360 square inches, to be the standard. All boxes weighing over 136 pounds to be paid for as over weight, 112 pounds as basis."

The sheet and tin bar scale is based on 1.1-cent card and the rates are the same throughout. The scale for structural mills, journeymen roll turners and the addenda are the same as in the old scale.

(By Telegraph.)

After a two days' session in Pittsburgh, a wage scale fixing wages in iron and steel sheet mills has been arranged by the conference committees of the Association of Iron and Steel Sheet Manufacturers and the Amalgamated Association. The scale originally proposed by the Amalgamated Association was based on a bar iron card of one and one-tenth cents, and for every advance of one-tenth cent on bar iron the sheet scale was to advance 2 per cent. The manufacturers strongly objected to having the sheet scale based on a bar iron card, and after a long discussion this was withdrawn by the conference committee of the Amalgamated Association, and the new sheet scale agreed upon, based on No. 27 gauge sheets at two and one-half cents, and for every advance of one-tenth cent per pound above this base price wages in sheet mills shall advance 2 per cent. The conference committees of the Tinned Plate Manufacturers' Association of the United States and the Amalgamated Association are now in session in the Conestoga Building, Pittsburgh, Pa.

Further Troubles Ahead in Wales.

It is not improbable that a general stoppage of the Welsh tin plate works may take place at the close of the present month. If a resolution recently adopted at an important meeting of the General Council of the Tin Plate Workers' Union can be enforced there seems to be no other course before the Welsh manufacturers. The option offered to them by the workmen is between a general shut down and a restoration of wages to the original scale adopted in 1874. This scale, the men assert, provides only a living wage. In other words, instead of obtaining any further reduction in the wage scale the makers are called upon to forego the 12½ per cent. concession they obtained from the workmen early in the year. That they will do this is virtually out of the question under

Present conditions. It is a fact, often asserted by makers and generally appreciated by the trade, that at the present price of plates makers cannot produce them at a profit under the old wage scale, made when plates were selling at anywhere from 50 to 75 per cent. higher.

The Welsh tin plate workmen persistently ignore this fact. They argue that wages have been reduced in order to meet American competition, but that the reduction was unnecessary, as it has given the opportunity to American makers to again manage to lower their prices, by cutting wages, in order to approximate the Welsh cut rates. Had not Welsh prices been lowered, they say, the reduction in American wages would never have taken place. As prices of raw material are going up in the United States, it is presumed that the tin plate manufacturers will have either to cut wages again or put up the price of their plates. In either prospective event the Welsh workmen think they see the favorable moment for an advance in their own wages and in the price of the Welsh product. They contend that wages should govern prices and not prices wages. The calculation was made by the Tin Platers' Council that in the six months ending June the tin plate workmen have lost in wages, through reductions, \$260,000. This sum, they claim, could have been retained by the manufacturers instead of being handed over gratuitously to their American and foreign customers.

At the council meeting a resolution was passed expressing approval of the recent manifesto issued by the union, a copy of which was printed in *The Metal Worker* a few weeks ago. The form of motion which was adopted in regard to the wage scale was as follows:

"That this council determines, as a means to secure a uniform rate of living wages, to instruct all tin plate workers to refuse working after June 30, except at rates of wages generally known as the 1874 list."

This motion was carried unanimously, together with a further resolution that for the month of June subscriptions to the union should be doubled, in order to meet prospective expenses attending any coming stoppage of work. So the situation stands in Wales at the present time. The fact seems to be that the men are haunted by the fear of further wage reductions, and so have adopted heroic measures, whereby they expect to sink or swim. In either case the outlook for the makers is not cheering. They are "between the devil and the deep sea," to use a forcible expression, and the way out of their dilemma is not plain to see.

Tin Plate Tongs.

From P. H. J., Philadelphia.—Does any firm make tongs for taking tin plates from the rolls which will not leave a mark on the plates?

Note.—We do not know of any concern manufacturing such an article, but will be glad if any of our readers who possess this information will kindly inform us for the benefit of our correspondent.

SCRAP.

THE heavy advance in the price of tin plate bars has caused advances to be made in the price of black plates, but the difference is not compatible with the increased cost of steel. For shipment during July, August and September higher prices are obtainable, but for deliveries beyond that time dippers are not willing to make contracts at present figures.

THE proposed scale of wages for operating Morewood tinning sets contains slight advances for catchers and assorters. In making comparisons of wages paid on Morewood sets with automatic machines it has been found that one man working on the Morewood process receives more money than the whole crew on automatic machines. The difference in prices obtainable for finished products is so slight that the first named process is considered by some manufacturers a luxury instead of a source of profit and a reduction in wages deemed absolutely necessary or that method of manufacturing will have to be discontinued. Such are the expressions of opinion made by those who have adopted the process. The quality of the product is undoubtedly fine, but market values do not warrant the heavy expenses for labor.

A SAN FRANCISCO correspondent writes: The tin plate demand is just reaching expectations for the fruit crop season. A sufficient stock is always carried to meet the demand at this time of the year and there is no flurry in the market. An enormous amount of fruit will undoubtedly be canned this year. A great impetus has been given to the foundry business by the revival of mining, not only in California but all over the coast. The foundrymen report some heavy orders for mining machinery and have their hands full.

MANY black plate mills are now able to run full time, as there is a larger supply of tin plate bars than during the past two months. Many of the Indiana mills are now able to operate to their full capacity, and mills in Ohio have secured ample supplies of materials. The various steel mills of the country now have a capacity of about 1000 tons of tin plate bars per day, cut to length ready for use.

THE report that the Bellaire Nail Works of Bellaire, Ohio, have commenced the erection of a tin plate works is incorrect. The company will build a new mill for rolling sheet bars and tin plate bars, and skelp and bridge plate. They are not yet ready to give any details as to size and capacity of the mill.

JACOB MEURER of the firm of Meurer Brothers Company, 575-577 Flushing avenue, Brooklyn, has just returned from a business trip West, in the course of which he attended the meeting of the Tinned Plate Manufacturers' Association, at Pittsburgh, and visited a number of the works in the Indiana gas belt and the Pittsburgh and Wheeling districts. Mr. Meurer reports that all the mills are as busy as they can be, with orders on their books sufficient to keep them in operation well on toward the fall. He speaks in the highest terms of some of the mills which have recently been put up, and also of the quality of the product turned out by them after a very short experience in the manufacture of black and tinned plates. Very little fear is expressed in any quarter as to the future of the American tin plate indus-

try. The only complaint to be heard among the manufacturers was the difficulty they at present experience in obtaining a sufficiency of tin plate bars.

J. J. THOMAS has resigned the management of the mill of the Lalance & Grosjean Mfg. Company, at Harrisburg, Pa., to take the position of superintendent of the extensive plant of the Midland Steel Company, Muncie, Ind.

LAMBERT, STOUGHTON & COOPER, Philadelphia, have found their business in palm oil for tin plate manufacturers, and other oils, increase to such an extent as to require additional accommodation in their manufacturing department. They have just completed the erection of a three-story brick building, 40 x 100 feet, at 848 and 850 Swanston street, and have installed therein a large number of presses and refining tanks and other articles pertaining to the equipment of a first-class refinery. The new building, with their four-story warehouse on Petroleum street, and their other storage facilities, will, it is hoped, enable them to take care of their heavy imports and increase their capacity for business. The firm have on the market four brands of palm oil, which they state are in good demand and increasing in popularity each month. The firm claim to be the largest direct importers of palm oil in the country, and that their refining methods are conducive to the production of oils especially adapted to the requirements of tin plate manufacturers.

W. F. JANEWAY, Columbus, Ohio, manufacturer and jobber of tin plate, sheet iron, solder and tinner's supplies, is distributing a neat desk blotter, on one side of which is an announcement calling attention to the Franklin Reddipped roofing plate, which, it is claimed, is meeting with great success. The statement is made that each box carries 30 pounds of coating, evenly distributed over the surface of the plates, every sheet being resquared and stamped. Another form of blotter distributed by Mr. Janeway carries a list of his other special brands of roofing plates, namely, A. L. Old Style, Harold, Emory, Dennis and Lowery. He claims that he has now obtained a complete line of roofing plates so as to cover all the requirements of the trade, from a cheap grade to the very highest quality.

THE WORKS of the Beaufort Tin Plate Company, Morriston, South Wales, have been rendered idle, the workmen having struck in consequence of a dispute as to the discharge of one of their number.

THE DYFFRYN TIN PLATE WORKS of Daniel Edwards & Co., Morriston, South Wales, have restarted, and those of the Blaia Iron & Tin Plate Company, Limited, will resume in July, having made terms with their workmen.

THE TIN PLATE TRADE will notice the announcement printed in our advertising columns this week and signed by Robert B. Byass & Co., through their New York agents, H. Whittemore & Co., 62 William street, to the effect that spurious terne plate bearing their trade-mark is being manufactured and sold in the United States, and that they notify all parties dealing in such spurious plate that they will be held strictly liable for damages. A facsimile of the trade-mark, which we are advised is registered in this country, is shown in the announcement.

FROM AKRON, OHIO, comes the announcement that O. C. Barber, president of the Diamond Match Company, and Monroe Seiberling of the Diamond

Plate Glass Company, in connection with several other capitalists, have decided to erect a large tin plate plant in that city. It is stated that A. P. Baldwin of the Akron Iron Company will be superintendent of the new concern.

THE TOTTEN & HOGG IRON & STEEL FOUNDRY COMPANY, Pittsburgh, Pa., manufacturers of rolling mill engines, rolling mills and tin mills, have just received a second order from the National Tin Plate Company, Anderson, Ind., for two more 24-inch hot mills and two 24-inch cold mills, with rolls and everything complete. This new equipment will be added to the plant now under construction at Anderson, Ind.

ONE of the most complete and best equipped tin plate plants in this country is that of the Ellwood Tin Plate Company, at Ellwood City, Pa. There is a main building, 200 x 180 feet in size, of corrugated iron, which contains the black plate mills, the annealing and pickling departments. In the black plate department there are four hot mills 24 x 30 inches in size, four cold mills 24 x 32 inches, four heating furnaces, four pair furnaces, four doubling shears and three squaring shears. The pickling department is equipped with a Mesta patent pickling machine, and in the annealing department are five large annealing furnaces. The tinning department is located in an iron building 50 x 100 feet in size, and contains six Thomas & White tinning machines and two Morewood machines. The assorting room is 45 x 40 feet in size. When in full operation the plant has a capacity for turning out from 2500 to 3000 boxes of tin plates per week. The concern make all grades of bright and roofing plates, which have given entire satisfaction wherever used. The entire plant is now in full operation, and the concern have sufficient orders on hand to keep them busily employed for some time to come. The main offices and selling departments are located in Cleveland, Ohio.

ENOCH STAMFORD has been appointed manager of the Lalance & Grosjean Mfg. Company's mill at Harrisburg, Pa., in place of J. J. Thomas.

MONROE SEIBERLING of Kokomo and R. C. Beatty of Elwood, Ind., are said to be looking for a good location for a large tin plate plant, which they purpose building somewhere in the Indiana gas belt.

THE Abbey Tintern Tin Plate Company's works, Tintern, Gloucestershire, which have been running spasmodically since the death of their owner, Mr. Griffiths, a year ago, shut down indefinitely the week before last, and are not likely to be again put in operation.

THE Vernon Tin Plate Works, Briton Ferry, South Wales, an 8-mill plant, which have been idle for some months, restarted at the beginning of this month.

THE whole of the tin plate works at Pentardulais and Briton Ferry, South Wales, are reported to be again in full operation.

A NEW sheet department is being added to the works of Zug & Co., Pittsburgh, Pa. It contains two trains of rolls, and will have a capacity of about 80 tons a week. All sizes of sheets will be rolled, and it is understood that thin plates for tinning purposes will be included in the product.

THE French Government is reported to have placed an order with the Aluminium Company of Neuhausen, Switzerland, for the supply of 45 tons of aluminum for marine purposes.

STEAM AND HOT WATER.

Convention of Master Fitters.

The Master Steam and Hot Water Fitters' Association of the United States completed the proceedings of its seventh annual convention late in the evening of Friday the 14th inst. After transacting considerable business in executive sessions held in the afternoon and early evening, the convention was, about 9 o'clock, declared to be in open session. Election of officers for the ensuing year was immediately proceeded with. The report of the Committee on Nominations was presented and on motion received. The voting was, on motion of W. O. Thompson, made unanimous by the casting of one ballot by the secretary. The following officers were elected:

President, H. D. Crane, Cincinnati.

Vice-President, Arthur C. Walworth, Boston.

Treasurer, Elias D. Smith, New York.

Executive Committee, Wm. P. Thompson, Philadelphia; James Curran, New York; D. M. Quay, Chicago; Chris. Branch, St. Louis, and F. J. Williams, New York.

Sergeant-at-Arms, H. A. R. Dietrich, South Bethlehem.

E. D. Smith asked that a committee be appointed to audit his accounts as Treasurer. J. B. Hughes then moved that the treasurer's report be accepted without audit and the motion was carried unanimously.

The place for holding the next annual convention was then decided upon, St. Louis being the choice of the meeting.

The essays which were to have been read before the convention were, for want of time, ordered to be printed in the official report of the proceedings and thus considered as read.

A committee from the Central Supply Association comprising Hughes, Walker and Gark was then received and informed that certain matters submitted by that association to the convention had been discussed in executive session and referred to the incoming executive session.

After a vote of thanks to the retiring officers the convention adjourned.

THE Wilks Mfg. Company, Chicago, Ill., report a very large trade on the Wilks hot water heaters. The late cold winter gave their heaters, which have been installed in all parts of the country for house heating, a good test, and giving the best satisfaction in every case has started an increased demand for them for this purpose. For house heating they have not hitherto been generally introduced, but have been well known and appreciated for many years for supplying hot water in all quantities. They also furnish an

improved steam generator for steam heating, &c., and will be glad to furnish all information, catalogue, &c.

The American Society of Heating and Ventilating Engineers

A purely unconventional meeting of the American Society of Heating and Ventilating Engineers was held on Friday, June 14, in the parlors of the H. B. Smith Company, at the Continental Hotel, Philadelphia. It was presided over by the president, Stewart A. Jellett, and the following members were present. Wm. Mackay, C. S. Onderdonk, D. M. Quay, J. A. Goodrich, L. H. Hart, H. J. Barron, J. J. Wilson, B. H. Carpenter, T. B. Cryer, Robert Monroe, A. G. Paul, W. H. Hill, W. H. Clark, H. A. Joslin, W. A. Russell, A. C. Edgar.

The secretary gave a résumé of the work that had been done by the different departments since the convention, and members of the different committees gave a synopsis of their plans and asked the assistance of the members who could aid them in their labors. On motion of D. M. Quay, a resolution was adopted to send the greeting of the society and its best wishes to the Association of Steam Fitters in convention.

The members discussed different topics of interest to the society and before disbanding, on motion of W. M. Mackay, a vote of thanks was given to the H. B. Smith Company, for the hospitality extended.

Trade Schools.*

BY CHAS. J. GILLIS.

In the fall of 1894, the New York Trade School, founded by the late Col. Richard Tylden Auchmuty 14 years ago, and situated on First Avenue, Sixty-seventh and Sixty-eighth streets, New York City, informed the local organization of Master Steam and Hot Water Fitters' Association of New York City that they were ready to establish a class of young men in their instruction in the erection of all kinds of steam and hot water heaters and mechanical appliances connected with them. The local organization appointed a committee to assist the trade school authorities in formulating a plan of instruction in the proposed class, consisting of John J. Smith, Enoch Rutzler, J. D. Clark, S. J. Geoghegan, James Curran and Charles J. Gillis. Ample room having been furnished, on the recommendation of the committee Mr. Thomas E. McNeill, a mechanical engineer with large experience in erecting steam heaters, was placed in charge of the class, assisted by Charles A. Coolidge, a practical steam fitter. The class started with 13 members from different parts of the country. Mr. McNeill delivered two addresses each week to the class on the scientific aspects of the business, on steam, its power and vast influence upon modern civiliza-

tion; on the construction of the various types of steam and hot water heaters, explained the operation and construction of steam pumps, of gauges, pump governors, injectors and return steam traps and the articles used in the construction of heaters. Mr. Coolidge showed the class all about the different sizes and kinds of wrought iron pipe, the use of screw plates, taps and dies, cutters, cocks and valves. He made the members of the class work with their own hands, cutting in the steam traps and all the labor necessary for a complete apparatus, and after some weeks of daily instruction in these matters he furnished each man a drawing and made each pupil cut all the pipes to measure and piece to put them up, connecting them with radiators, boilers and tanks. This was repeatedly done during the term of three months' instruction until every one of the graduates had personally put up an apparatus with his own hands, for the instructors did not themselves do any of the work, only directed how it was to be done. The graduates of the school were men instructed in the manner set forth, must, of necessity, know more about the business when they graduate in three months than the helper, who by the rules of their unions, cannot become a steam fitter until he has served five years. The graduates of the school ought, after serving as helpers, to be admitted to the steam fitters' union.

The graduating class, 11 members, two from New York, four from New Jersey, two from Massachusetts, one each from Wisconsin, New York State and Illinois, received their diplomas and departed to their near and distant homes, and may, if the rules of the unions permit, at once commence work as helpers at good wages, and at no distant day become members of the National Association of Master Steam and Hot Water Fitters.

The steam heating business is but 50 or 60 years old, one of the founders, the venerable James J. Walworth of Boston, upward of 90 years old, being still with us, while many others more than 70 years old will soon be joining the vast majority beyond the skies, far away from the cantankerous architect and the lowest bidder on contracts; and presumably, if they have done good and honest work, will be at rest in the good and honest work of the divine music of St. Cecilia and her choir of attendant angels. And who is to take the places of these departed ones? Surely the educated mechanic. Surely the graduates of the trade schools.

After the experience of the first season of the steam heating branch of the New York Trade School it may be considered a pronounced success, far reaching in its consequences, calculated to make better and more successful mechanics, and to place the business in a more dignified position. Let us always remember with profound reverence the founder of this school, Col. Auchmuty, who, in the latter part of his life constantly suffered from a severe wound received in the war of the rebellion, patiently listened to the application for the formation of a class for instruction in steam heating and gave his consent.

Battling, at the conception of this enterprise, with difficulties which would have rapidly discouraged many less heroic spirits, he persevered with a fixity of purpose begotten of unshaken confidence in the righteousness of his endeavor and its practical value to the community. Always avoiding notoriety, and only accepting publicity because of its educational influence upon other communities, he pursued his course with a single-heartedness as admirable as it was efficacious. Steadily developing the scope of the institution, and perfecting its methods of operation, he had just completed his studies and finished the preparation of his text-books when death intervened.

Let us also give due credit to the noble and successful efforts of the present managers of the trade school, R. Fulton Cutting, Pierrepont Morgan and their asso-

* Presented at the Seventh Annual Convention of the Master Steam and Hot Water Fitters' Association of the United States, held at Philadelphia, June 13-15.

ciates, who continue the good work of the founder.

We read in the newspapers that a lady in San Francisco has left \$3,000,000 to establish a trade school in that city. Trade and technical schools are already in full operation with marked success in Philadelphia, Brooklyn, New York, Boston, Ithaca, and many other places.

I hope the members of this association will bring their influence to bear upon such institutions and get them all to have classes of instruction in the erection of steam and hot water heaters.

Double Novelty Circulator.

The accompanying illustration shows a double boiler put on the market by the Model Heating Company, Philadelphia, Pa. In referring to the construction of this heater the manufacturers allude to the peculiar internal construction which presents the heat-

The House Heating Boiler Question: How to Regulate.*

BY JOSEPH W. MILLS.

During the years I have been engaged in the heating business it has been my fortune to be closely connected with the manufacturers of the boilers which I, as a contractor, have handled. I have also been, during a portion of that time, an officer and manager of the Western business of a prominent manufacturing company. In considering this question I therefore view it from the standpoint of the manufacturer as well as from that of the contractor.

From the knowledge I have I am justified in saying that it is the desire of some, and, I believe, of most boiler manufacturers, that the business of manufacturing should be confined strictly within the limits indicated by the term; that is, that they should make and sell their wares to those who use such in their contracts. In connection with this is the other natural desire

furnaceman to make steam fitting a branch of his business.

It can hardly be regarded as a serious breach of propriety for a boiler manufacturer or any other business man who may possess the confidence of such a journeyman, or plumber, or furnaceman, to advise him, if his judgment so dictates, in favor of starting in business or of adding a heating branch to his already established business.

Unquestionably it is also proper for a manufacturer to extend credit to a journeyman so starting, or to one already in business on a comparatively small scale. A man's reputation and acquaintance is justly considered part of his capital. We all of us know cases where a man with little, if any, financial responsibility is able to get credit beyond what the state of his finances would strictly warrant, because some manufacturer or some jobber has known him for many years and known him to be so honest, so industrious, so expert and so intelligent that he is, in all human probability, certain to make a success of his enterprise.

The serious question is where to draw the line. We sometimes see in a town where business is good and all the established steam fitters have such affiliations with certain boilers that a new manufacturer cannot get one of them to take up his line, that he will make for himself an agency in one of three ways. He will induce a plumber or hardware man to take up steam fitting, with the lure of big profits, promising him the necessary expert assistance; he will encourage or request a journeyman fitter—possibly one in his own employ—to start a shop in that town, giving him the necessary financial backing; or he will take up some fourth-rate man already located there—a man without ability or credit—and sell him goods on a scale in no way commensurate with what the business merits of the case justify.

It is often difficult to determine whether the manufacturer who pursues one of these courses is acting on his best judgment or whether he is deliberately using the men or firms in question as blinds behind which he may himself carry on the contracting business. In many cases his action is based on deliberate and full knowledge, and is an unquestionable violation of our rights. Often, however, the same course is pursued by manufacturers new to the business, who have no comprehension of the certain outcome of such a policy or of the effect it will produce in the minds of the best of us in the trade, whose good will they are, or should be, anxious to secure and retain.

Whether the course complained of is pursued through ignorance or with full knowledge, it is, I presume, equally obnoxious to us. If there is any distinction, it might perhaps be said that the ignorant manufacturer does the more harm, because he will go further in the direction complained of.

As an old manufacturer, I am bound to say that I think the manufacturers have not been without their occasional grievances. I will leave out of sight the fact that some of us are not only contractors, but also manufacturers, and are therefore hardly in position to criticize the manufacturers who would also be, occasionally at least, contractors. But I think it cannot be truthfully denied that, while we who are strictly contractors have been asking the manufacturers to refrain from contracting and to confine their dealings as closely as possible to those who stand the highest and are the longest established in our trade, we ourselves have not always reciprocated. When we have had occasion to use a patent boiler, we have sometimes been quick to furnish a customer with a boiler that might risk for, in order to save our own time and breath. We have, perhaps, where the selection of the boiler was left to our discretion, in some cases, used the one which would cost us the least money and thus enable us the more easily and surely to secure the contract, or, having the contract, to make a larger profit. This we have never done with deliberate purpose to support the manufacturers who offend us as against those who seek to aid us, but in thoughtlessness and possibly sometimes a little of indifference. I think we must in all justice admit that we, who are so strenuously insisting upon the manufacturers acting in accordance with our interests, should, when we have occasion to erect apparatus within the range of sizes of the patent boilers, give to our friends such substantial encouragement as shall show them that we also are their friends. Let us pay them, perhaps, a few more dol-

Double Novelty Circulator.

ing surface in such a manner that the products of combustion are compelled to impinge on all parts before reaching the smoke outlet. The heating surface of each section is composed of ascending and descending flues, which are described as practically self-cleaning, being pointed at the top and bottom. When built the boiler flues are staggered, bringing a large amount of heating surface in direct contact with the fire. Asbestos gaskets are used for joints between the sections which are fastened with steel bolts through the water ways. The manufacturers refer to the special machinery employed in finishing the sections, which, they say, insures absolutely tight joints. The boilers being sectional are easily handled, and any part can be taken through an ordinary door. Double boilers are particularly recommended for schools, churches and office buildings where a large grate area is required, while in mild weather a single boiler can be used, the two being so arranged that each can be fired independently of the other in case of accident or need of repairs.

that their field shall not be encroached upon by those whom in their policy they protect.

There is no doubt in the minds of any of us that manufacturers should mend their ways in many respects. They should never, under any circumstances, sell the boilers, radiators, or similar supplies which they manufacture to any not regularly in the trade or on the exempt list. They should refrain from contracting either directly or through the medium of small contracting houses supported, if not actually established, by them, fitters who rely entirely upon them for credit and who give them all their profits beyond ordinary fair steam fitters' wages.

This brings up a problem which is a most difficult one. It relates to the building up of new steam fitting concerns. It is unquestionably within the right of any first-class, ambitious journeyman steam fitter, who shall have accumulated a little capital and established a reputation for good work, or who can command the necessary capital by borrowing or by associating with himself a business partner, to engage in business as a heating contractor. No doubt it is also within the right of a plumber or

* Presented at the Seventh Annual Convention of the Master Steam and Hot Water Fitters' Association of the United States, held at Philadelphia, June 13-15.

lars and use our influence to get the extra price from our customers. If a specified boiler is made by one of the manufacturers who have antagonized our interests, let us spend a little time to get the specification changed. I believe not only that this is a matter of common fairness, but that it is good business policy for us to keep all the friends we have and to make new ones, and at the same time to discourage our enemies and their methods as much as possible.

Having analyzed the evil, we must consider how to remedy it. That is something that I will not attempt to go into. It is worthy of the best deliberations of the wisest heads in this body. We can simply start out with the proposition that we do not want manufacturers, in their efforts to make a market for their goods, to build up for us ignorant, incompetent and irresponsible competition. Fair competition we gladly welcome. We are always pleased to see a good business man, a man who is seeking to build up a successful business, a man of character and of mechanical ability, join the ranks of the Master Steam and Hot Water Fitters. We can compete with him in a way that will do him and ourselves good, but let us see if we cannot stop the manufacturer from bringing to bear against us his overpowering facilities, by contracting in the name of a stool-pigeon, and also prevent him from multiplying many times the number of men and firms engaged in a business already sufficiently full.

Convention Aftermath.

G. W. LEWIS visited the convention, and his cards bore the inscription of the Boynton Furnace Company, New York, manufacturers of steam and hot water boilers.

SAM O. DUGGER came on from Chicago to greet the Western delegates and patrons of the Standard Radiator Company, Buffalo, N. Y.

The steam specialties of G. M. Davis & Co., Chicago, were well represented by W. E. Davis.

H. H. GIBBS came from Buffalo with the new 6-inch wide radiator just being shown by the Niagara Radiator Company, Buffalo. This radiator is looked upon as one of the greatest "Falls" that the boys have ever wrestled with.

The bronze man did not mean the Penn statue on the City Hall, but Bernhard Meiner's representative, Wm. F. Aarons, New York, who was a very genial gentleman, presenting a card printed in a beautiful blue bronze just the thing for radiators.

DON J. HERSEY, steam and hot water heating engineer, representing F. Coggeshall, Providence, R. I., showed a new pipe wrench that was voted capable of doing a good turn.

ALEXANDER DON, 61 Gold street, New York, explained the merits of the Bard expanding nipple holder to the pipe fitters. This device is made by Geo. F. Bard, Norwich, Conn., and enables close nipples to be readily cut and threaded either by hand or machine. Mr. Don is the manager of the New York office of the W. H. Page Boiler Company, Norwich, Conn., and what he volunteers on the steam and hot water heating question is *All Right*.

JOHN A. SCOLLAY, 74 Myrtle avenue, Brooklyn, arrived at the convention on the last day, looking hale and hearty, and was well acquainted with the young and also with the older members of the steam and hot water heating trade. He brought with him an 1851 catalogue of steam fitters' supplies put out by the elder Walworth and his partners from 79 John street. Mr. Scollay sent this book by A. C. Walworth to Boston, so that the senior Mr. Walworth might again look over one of his early catalogues.

The Niagara Radiator Company of Buffalo, Chicago and New York exhibited at the recent convention in Philadelphia samples of the new radiator which is called the Niagara Jr. It is a radiator of exceptional beauty and superior casting. It measures 4 feet of heating surface to the section, standing 40 inches in height and 6 inches width, connected with push nipples top and bottom. A deserved success for this addition to their varieties was predicted by some who saw it.

HEATING NOTES.

W. E. MORGAN & Co., Oakland, Cal., explained their plan of heating some new school buildings to the committee by introducing a model school, with miniature flues, chimneys, &c., which, when set before the committee formed a unique object lesson, the passage of the air through the building being illustrated by means of tobacco smoke, blown through prepared openings in the tiny school house.

WARREN WEBSTER & Co., INCORPORATED, Camden, N. J., have just issued a 56-page catalogue descriptive of the Williams "Vacuum" system of steam heating. With this system the firm guarantee that exhaust steam may be utilized without back pressure on the engine, so that the cost of power and heat is no greater than the cost of power alone; and when applied to plants in which live steam only is available for heating at high pressure it is claimed to be almost equally valuable. In several instances, it is stated, an initial boiler pressure of 24 pounds has been sufficient to insure better circulation and more efficient heating than previously obtained from the same piping under 80 pounds pressure. The saving in fuel, power and boiler capacity is explained, and plans of the system are shown in connection with the text. The greater part of the book is taken up with reduced *fac-similes* of testimonials received, copies of injunctions restraining infringements, and references to concerns already using the plants. The catalogue appears in stiff paper covers of orange color, and is gotten up in the firm's usual good style.

H. R. IVES & Co., Montreal, Canada, issue a four-page circular in the interests of the Buffalo hot water boiler of their manufacture. On the front page is an illustration of the medal awarded them at the Columbian Exposition; a general view of the boiler is shown and some of its special features alluded to. The inner pages present plans of the heating apparatus of the Government House at Ottawa, Ontario, in which Buffalo boilers are used. The last page gives a number of testimonial letters.

The New York Central Iron Works, Geneva, N. Y., are issuing to the trade a circular of the new Drunning Club boiler for steam and hot water heating. The circular is illustrated with a cut in two colors showing the construction of the boiler, the arrangement of the grate and the expanse of heating surface exposed to the fire. The circular also gives the full dimensions of the five different sizes of the boiler.

THE ASHTON Valve Company, Boston, Mass., are issuing a red covered catalogue, showing illustrations of the different kinds of Ashton's pop safety valves, their water relief valves, steam pressure gauges, ammonia gauges, hydraulic gauges, marine clocks, engine registers, and square counters. Their hydraulic gauges are designed to record pressure up to 10,000 pounds to the square inch.

E. M. BOSLEY, 412 North Eleventh street, St. Louis, Mo., has recently taken out a patent for the incandescent superheating steam boiler, which is said to burn soft coal without smoke and to make steam with any kind of fuel. It is of the horizontal construction, and made of boiler plate.

W. H. WILKINSON AND JAMES W. PICKARD, under the firm name of Wilkinson & Pickard, will engage in furnace, steam and hot water heating, and heating and ventilating sheet iron work, at 210 Water street, New York.

THOMAS W. HARTLEY of Couch & Hartley, Hartford, Conn., was a visitor among the heating trade of New York this week.

THE Nason Mfg. Company, 71 Beekman street, New York, make a specialty of pipe bending along with their other steam supplies. One afternoon this week a coil of 24-inch heavy wrought iron pipe, measuring 30 inches in diameter and 6 feet in height, attracted some attention in front of their establishment.

EDWIN R. STOUGHTON AND F. W. JAQUI, look after the steam and hot water business of the Thatcher Furnace Company, 240 Water street, New York, and the Champion boilers are meeting with increasing sales.

OLIVER SCHLEMMER, Cincinnati, Ohio, visited the heating trade in New York after the conventions, showing his new distributing fitting, which is designed to save several joints in pipe fitting and to supply radiators on the first floor with hot water from the same flow riser that heats radiators on upper floors. The fitting is a reducing T, and is provided with a partition which distributes the rising current of hot water.

A Parliamentary paper just issued gives some interesting information in regard to the decrease in value of lands in Great Britain within the past 25 years. It shows that the total ratable value of the property assessed in 1870 was \$524,350,000, while in 1894 it was \$805,405,000. The ratable value of land, however, which increased considerably in the first ten years after 1870, is shown to have since declined materially. In 1870 the ratable value of land was \$199,175,000, or more than one third of the whole ratable value; whereas in 1894 it was only \$168,270,000, or barely one-fifth of the whole.

A canal is to be constructed from Marseilles to the Rhone, a distance of about 35 miles. The most important feature of the work will be a tunnel 4½ miles long. The depth of the water is to be 6 feet 6 inches between the Rhone and Port de Bouc and 10 feet from thence to Marseilles. The width will be sufficient for two paddle vessels, 46 feet wide, to pass each other, boats of this character being largely used on the Rhone. The cost is estimated at \$16,000,000, one half of which will be borne by the State and the remainder by the Marseilles Chamber of Commerce and the city.

The Canadian "S.O." Canal was formally opened at Sault Ste. Marie, Ontario, on June 13. The new canal runs through St. Mary's Island, on the north side of the rapids on the St. Mary's River, and provides Canada with independent communication with Lakes Huron and Superior. The length of the canal and its approaches is 18,100 feet. The cost of building it has been about \$4,000,000.

THE RETAIL STORE.

The "Knock Down" Steel Range.

A range possessing many interesting features of construction is being offered the trade under the name of "Knock Down" by the K. D. Steel Range Company of 119 Woodland avenue, Cleveland, Ohio. This stove is made of double annealed patent leveled steel, the front, back, ends, top and bottom

The "Knock Down" Range Crated for Shipping.

plates being separate parts and neither riveted nor bolted, but held together by a mechanism of the company's invention. The fire box has brick linings resting on a perforated grate, thus allowing ample ventilation between the linings and the oven plates. The grate used is of the company's invention, being a hollow cylinder with tooth-like projections designed to agitate the ashes and clinkers. The perforations between the tooth-like projections serve a triple purpose. They allow the ashes to drop through freely, give ample ventilation and draft and tend to prevent warping. The toothed side bars which meet the projecting teeth of the hollow cylinder can be revolved in either direction by means of a crank handle, for the purpose of dislodging ashes or clinkers. The construction of the grate is such that it is always in position without regard to the way it is turned or left. The oven plates are separate from each other, and so put together as to prevent all warping and buckling, which are always sources of annoyance. The end plates are lined with heavy asbestos paper, which is designed to prevent radiation of heat into the rooms, this arrangement also resulting in economy of fuel. The elevated oven has a revolving door and nickel plated drop shelves, which are useful as well as ornamental. The company manufacture three styles and four sizes of family ranges, one style with a perforated cast base, which is in sections, and one style with two front legs of steel, while the third style is without cast base. The "Knock Down" steel range is so constructed that the various parts can be easily replaced without trouble. The company make a point of their facilities for shipping, referring to them as being very advantageous to the trade, for the reason that the range when crated occupies less than one-quarter the space occupied by similar stoves as ordinarily shipped. An idea of the appearance of the range when crated for shipping may

be gained from an inspection of the accompanying illustration. The compact form in which the range can be shipped results, the makers claim, in a saving of storage, freight, breakage, loss and time in handling. Each part is labeled and full directions for setting up the stove are given on a circular which accompanies the shipment. The company state that their ranges are sold under an absolute guarantee that the material and workmanship are the best and that the stove will operate with entire satisfaction in all cases under proper conditions.

Combination Soap and Sponge Holder.

Bernard & Frank, 174 Fulton street, New York, have just placed on the market the patent combination soap

Combination Soap and Sponge Holder.

and sponge holder illustrated herewith. The holder is made of brass wire, nickel plated, with a ratchet arrangement on the top which makes it adjustable to any width of bathtub rail. The device is recommended as doing away with the inconvenience caused by placing soap, brush or sponge on the bath ledge or having them floating in the water. All the bathing accessories are by this means kept within easy reach, the holder being hung inside the bathtub. The device is also made with a porcelain soap cup in place of the wire arrangement shown in the cut. Another form of holder is made without the long sponge rack, giving only a place for the soap and brush.

The Lamp Trade.

Buyers of Lamps and Lamp Goods can scarcely fail to be impressed with the remarkable changes this department of trade has undergone within the last few years. Concerns who not long ago made a few primitive patterns, mostly staple, have energetically increased their output until one is almost bewildered by the profusion of styles, patterns and kinds of Lamps seen in their elegantly appointed showrooms, from the unassuming Spun Brass Table Lamp to Parlor and Banquet Lamps costing hundreds of dollars, with mountings of rare china, porcelain, cut glass or metal.

With the elaboration and incorporation of valuable characteristics has come a great decrease in price. Ignoring entirely the more expensive grades, better Lamps every way throughout are to-day sold at \$6 each than were purchased several years ago at \$20, while in still more modest kinds, but handsome in appearance, \$42 a dozen will secure much better Lamps now than formerly brought \$100 for the same quantity. The decreased cost of raw materials, including copper, brass, spelter and onyx, and the lower level of wages accounts for much of this. Then competition and a wider market have stimulated inventive genius, and developed improved machinery and better methods. The great demand for onyx, for instance, has caused quarrymen to seek it, and pieces that formerly averaged \$3 each are now sold at a quarter of that sum; where a manufacturer would buy in lots of, say, 20 pieces, he can now handle quantities 15 to 20 times that amount at a time and at a great reduction in price.

Galleries abroad have been visited for models in bronzes, pottery, &c., from which to reproduce Lamp figures, shafts, columns, heads, &c. Much of this holds good with regard to shades so far as more handsome effects with a corresponding decrease in cost are concerned.

Barker's Cloth Holder.

The accompanying illustration shows a device upon which application has been made for a patent, and which is being introduced to the trade by Charles H. Barker, Danville, Ill. It is a towel or cloth holder for cleaning ceilings and walls. As shown in the cut, which illustrates the holder and also its appli-

Barker's Cloth Holder.

cation to a broom, the device consists of a wire frame connected at the ends by a strong rubber band. The frame is slipped over the broom as shown, and the rubber band passes around the broom proper and holds the cloth or towel in place. These holders will be put up in boxes of three and six dozen and sold at a very small figure.

ROBERT J. MASHACH, 80-82 Vesey street, New York City, has issued a 26-page pamphlet relating to the specialties which he manufactures. These include, among other articles, peanut and chestnut roasters and warmers, hotel tinware, &c. These goods are made in various styles and sizes and adapted to meet varying requirements.

The Ideal Hose Mender.

We show in the accompanying illustrations the Ideal hose mender, a patent for which has been applied for by L. H. Snyder, and which is put on the market by the Beaton & Corbin Mfg. Company, Southington, Conn. The two thimbles which fit in the ends of the pipe are held together, as shown in the illustration, by a clamp hinged at the back and closed by means of a screw passing through two flanges at the opposite side. The construction of the device is simple and it is claimed to be very efficient. The only thing neces-

sary to its application is a screw driver, and it is stated that it can be put in place in a minute. Fig. 1 shows the clamp open, while Fig. 2 shows it closed in use upon a hose.

The Ideal Hose Mender.—Fig. 1.—Clamp of Hose Mender Open.

Fig. 2.—Mender Attached to Hose Ready for Use.

Trimo Pipe Cutter.

Trimont Mfg. Company, Roxbury, Mass., are introducing the pipe cutter shown in the accompanying illustration. The frame of the cutter is drop forged from bar steel; the cutting wheels are drop forged from the best of tool steel, and the burr removing rolls are case hardened. It is explained that the construction of the cutter is such that when used as a single wheel cutter, as shown in the cut, it does not crawl

prevent chipping the cutting wheels by the twisting of the frame. The bearing for the handle in the frame is long, so that when the cutter is opened to its full extent the thread of the screw will not come out of the frame, the screw being surrounded by the socket of the frame to provide strength where it is required. The company remark that in practice they have found that the screws upon which cutter wheels revolve work loose, and to avoid this they have substituted straight pins, held in place by cotter. These are designed to make it more convenient when changing from a single wheel with rolls to a three-wheel cutter, and also to add strength, as the pins are of increased size. The manufacturers state that the tool is

one in the water section tube prevent any mixing of the liquids except while pumping. The different proportions of the liquids are obtained by a lever which operates a stop cock at the kerosene inlet. An indicator is placed on the tank to prevent mistakes in making the desired mixture. The nozzle used with the sprayer is either the Deming Vermorel or the Bordeaux. The latter, it is remarked, is adjustable to either fine, coarse or double spray, solid stream, degorgement and shut off. The point is made

Trimo Pipe Cutter.

Kerosene and Water Sprayer.

either to the right or to the left, but cuts a square end, also saving materially the breakage of the cutting wheel. The point is made that no burr is left on the pipe, but that it is smooth and ready for the threading die without the use of a file. Each cutter is accompanied by two extra cutting wheels, a receptacle for which is provided in the handle. The cutter is convertible from a single wheel with rolls into a three-wheel

made throughout in a workman like manner.

THE FIRM of Tompkins & Murphy, Norwalk, Conn., have been dissolved, and C. O. Murphy will continue the business of stoves, tin and hardware, wooden and willow ware, tin roofing, plumbing and gas fitting, at 26 Sixth street, the old location.

that kerosene as an insecticide has heretofore been made into an emulsion by the addition of soap suds or of scum milk, and that the making of kerosene emulsion requires care and precision, often causing trouble and loss of time. The device described is designed to obviate the necessity of making kerosene emulsion, and is accompanied by explicit directions for operating the sprayer and destroying insects on fruit trees, plants, domestic animals, &c.

Buzzacott's Camp Cooking Outfit.

A very ingenious camp cooking outfit, invented by a soldier in the United States army, is herewith illustrated. It includes everything needed for cooking, from the stove to the utensil required

long. One adjustable solid handle, so arranged as to fit any utensil for handling in any way when in use. Total, 16 separate utensils, the whole constructed without soldering of parts, permitting of even being heated red hot without fear of falling off of parts. Fig. 2 shows the outfit packed for car-

New Bristol Wick Lift.

Bristol Brass & Clock Company, 32 Warren street, New York, have just brought out the new Bristol wicking device shown in the accompanying engraving. This improvement will be incorporated in their new line of fine

Fig. 1.—Buzzacott's Camp Cooking Outfit.

for preparing the daintiest dish. An excellent idea of the several parts is shown in Fig. 1, in which the skeleton stove is seen in position for operation, while the various utensils are scattered about. The contents of the outfit are as follows: One skeleton stove; one

rying. It then makes a package 11 x 14 x 7 inches, about the size of an ordinary grip, and weighs but 15 pounds. A handle enables it to be easily carried. Small as it appears to be, it will do the cooking for four to six persons. Room can further be found if desired for packing in the above named space six plates, six cups, six knives, six forks and six spoons. Hibbard, Spencer, Bartlett & Co., Chicago, are sole United States agents.

The Quincy Corn Popper.

The Quincy Hardware Mfg. Company, Quincy, Ill., are offering the corn popper here shown. The handle of the popper is of tinned wire neatly twisted and so arranged as not to come loose from the basket. The handle wires project through the basket far enough to rest on the jam of a stove when the lid is taken off, as shown in the cut. It is explained that by revolving the crank the unpopped corn remains at the lower edge of the popper nearest the fire, thereby utilizing all the good grains. The lid of the popper slides on to prevent it from working loose. In operation the corn is shaken by turning the crank, by which action the makers claim that the corn is more

lamps prepared for this season's trade, a part of which are now to be seen at their warerooms in this city. By means of the mechanism used, which is shown in detail, the wick is raised in a positive manner by turning the thumb screw, causing the cage or frame to travel up or down the spiral at will, the thumb piece always remains in the same posi-

rest, 12 x 8 inches; one ladle dipper; one ladle strainer; one large cook's fork; one large cook's spoon; one turn-over; one salt, one pepper and one flour dredge. Handles of tools 12 inches

easily agitated and that it will not burn. The poppers are made in 1 and 2 quart sizes, and are packed either knocked down or put together complete.

Sectional View of New Bristol Wicking Device.

tion, not interfering with a 4-inch ring for holding the shade by rising above the top of the fount. In rewicking the frame is raised to the top, when the V-shaped rods cause the arms to spread automatically and free themselves from the wick. A new wick of any ordinary length can then be slipped on.

SIDNEY SHEPARD & Co., proprietors of the Buffalo Stamping Works, Buffalo, N. Y., favor us with circulars calling attention to a clearing sale of broken assortments, overstocks, &c. We also have a circular calling attention to Manny's patent lemon juice extractors, dairy milk strainer, nestable strainer pails, sanitary garbage can, ice cream freezers, elbows, registers, &c.

Self Heating Gas Iron.

The illustration presented herewith shows a self heating gas iron manufactured by Collier & Rice, rear 166 Lincoln street, Worcester, Mass., and which, it is claimed, has many points of particular merit. It is especially noted that the iron does not make any smell and the flame does not light back. The air and gas are mixed in correct proportions, insuring, it is claimed, perfect combustion and, consequently, economy. It will heat ready for use in

Self Heating Gas Iron.

ten minutes, and when once hot can be kept so at a maximum cost of three cents per day of ten hours. The temperature can be regulated by the stop cock controlling the gas. The iron, which is provided with a wooden enameled handle that is always cool, weighs seven pounds complete and is finished in either nickel or brass plate. It is easily cleaned and is simple in construction, so it is not liable to get out of order. It is intended for families, laundries, apartment houses, dress-makers, &c., and it is also made in larger sizes of any weight suitable for tailors' use by hand or machine.

Spirit Stove and Curling Iron Heater.

The accompanying cuts represent a German process spirit stove and a curling iron heater, put on the market by Silver & Co., 304-310 Hewes street, Brooklyn, and 20 Warren street, New York. The spirit stove, Fig. 1, has a double flame to increase the heating

Fig. 1—German Process Spirit Stove.

power. Two wicks accompany each lamp, the smaller one fitting entirely inside the tube. This, it is explained, does not burn, but from it a gas is generated which is ignited as it escapes through small openings at the top of the tube. The larger wick fits around the outside of the tube and burns as shown in the illustration. Each stove is provided with a cap for extinguishing the flame and for preventing evaporation of the alcohol. The curling iron heater, Fig. 2, is made with a wrought

iron base, in a dead black finish, for travelers or for home use. Alcohol is used in the handled lamp, for heating the irons.

New Triumph Meat Cutter.

The Peck, Stow & Wilcox Company, 27 Chambers street, New York, have

Fig. 1.—New Triumph Meat Cutter and Working Parts.

brought out the New Triumph meat cutter, as shown in the accompanying engravings. In the end of the cutting screw C is a square recess to receive the stud of the four blade knife D. The knife is kept in close contact with the reversible plate E by the adjusting screw F. The plate is held in position

Fig. 2.—Stuffing Attachment.

by means of the stud *a* in the shell entering the notch *b* in the plate.

Emphasis is laid on the capacity of the cutter, and ease and rapidity with which the five working parts are

is said, absolutely rust proof. They have lately added to their assortment a line of bailed galvanized garbage cans, which are finding much favor with the trade. These cans are made in three sizes, so arranged as to nest closely, and they are offered at prices that will allow dealers a handsome profit.

THE STOVENE MFG. COMPANY of Portsmouth, N. H., are doing a rushing business in their specialty, and it is stated that last week they shipped 150 gross of stovene.

THE BEARDSLEY MFG. COMPANY, Cleveland, Ohio, issue a tasteful pamphlet of their specialties in sheet metal. The illustrated catalogue, which is issued under date of May 1, is bound in paper, with the front cover of exceedingly neat design. The first goods

Fig. 2—Curling Iron Heater.

cleaned after use. There are two sizes, No. 605, cutting 14 pounds per minute, and No. 610, which cuts 3 pounds per minute. Both of these are made to clamp. No. 612 is the same size as 610, with feet to screw on table or bench permanently. The parts are all tinned. A stuffing attachment, as shown in Fig. 2, can be sent, when so ordered, at a small additional charge. This is used by removing the knife and plate and inserting the ring of the tube in the place designed for the plate.

shown are the improved double seaming machines for large and for small work, the former seaming cans 4 to 12 inches in diameter and 4 to 20 inches high, while the latter is for smaller work, such as color cans, &c., and will seam cans 2 to 4 inches in diameter and 2 to 6 inches high. Following these machines are illustrations, with price-list, of a large variety of cans, paint, color, dry color, oil, varnish, leather dressing cans, grease boxes, ink cans, pails, sput cans, wood jacketed oil cans and

many others. Nozzles of various sorts follow, and then come several pages given up to oil cans, with and without pumps. Torches, measures, stove showels, steam roasters and other goods complete the catalogue. It should be mentioned that each page of the pamphlet is decorated with a scroll design bearing the name of the company and printed in brown ink.

THE DEATH IS ANNOUNCED of Alonzo F. Harvey of Gloucester, Mass., at the age of 68 years. Mr. Harvey has been for the past 30 years a prominent member of the New England stove and tinware trade.

THE MACKINAW REFRIGERATOR COMPANY, Grand Haven, Mich., have brought out a number of handsome new Refrigerators, quite unique in their way, designed especially for hotels, clubs, restaurants, florists and kindred uses, supplementing their extensive line of Ice Boxes and Refrigerators for ordinary purposes. Those intended for such places as restaurants and clubs are large in size, with beveled plate glass fronts and sides, permitting a view of the daintily arranged contents, while the upper portion surrounding the ice chamber is paneled with beveled mirrors. Another type takes the form of an upright showcase, 24 inches square and about 4 feet high. This is similarly arranged to show the contents below on the several trays, while the ice chamber is embellished with beveled mirrors. Still another group, just added, resemble showcases to be placed on table or counter for florists, in which to preserve and exhibit cut flowers. These are made in single and double styles. In the double case the ice chamber in the center has a mirror front, the backs beveled mirrors with plate glass tops, fronts and ends. The single case is similar—ice chamber at the left. We were also shown a number of new Refrigerators for house use of quite an expensive character. One is lined throughout with heavy white porcelain enameled steel, another being entirely lined with glass. They are all of polished hardwood, cabinet finish, and can be made in antique oak or ash. B. B. Neal, 106 Chambers street, is the New York representative.

HENRY C. WEBER & Co. are about to move from their present location at 116 Woodward avenue, Detroit, Mich. across to 121-25 Woodward avenue. The increase in facilities thus secured is demanded by their enlarged business and in their new quarters they say they will have one of the finest stores in the West.

SIDNEY SHEPARD & Co., Buffalo, N. Y., issue a list of goods, comprising broken assortments, overstocks, &c., which they are offering at special net prices. This is accompanied by circulars illustrating elbows, Lightning freezers, milk cans, registers, ventilators, lemon juice extractors, nestable strainer pails and sanitary garbage cans.

BERT MILLER, dealer in stove and house furnishing goods, Waynesboro, Franklin County, Pa., also does work in roofing, tinning, plumbing, stove and wringer repairing. He desires that manufacturers and dealers send him circulars with price-lists of the goods in his lines.

JOHN H. WILBOURN, 180 Eddy street, Providence, R. I., is about to start in the hot air, ventilation and general tinsmithing business, and will be glad to receive catalogues from manufacturers in these lines.

Improved B. & H. Burner.

Bradley & Hubbard Mfg. Company, 26 Park place and 21 Barclay street, New York, are offering their extensive line of lamps for the ensuing season's trade, equipped with the B. & H. burner and new ratchet wick adjusting device, as here shown. The sectional view given in the illustration makes plain the interior mechanism. The object sought is to raise the wick with a positive or screw motion, rather than with a jerk, which often smokes or breaks the chimney. The wick can be lowered by reversing the motion or pushed down instantly with one movement by pressing

Sectional View of Ratchet Wick Adjusting Device.

on the loop. When necessary to rewick the burner the wick is turned up to the highest point, when the side clamps automatically release the wick and a new one is substituted.

Sidney Shepard & Co.,

23-25 Randolph street, Chicago, Ill., have issued a very elaborate catalogue of stamped and pieced tinware of all kinds. This is the largest catalogue issued by this house for several years, if, indeed, it does not surpass any of their previous publications. It consists of 255 broad pages devoted to illustrations and price-lists. The introductory pages show views of the Chicago house, the Buffalo house and the factories at Buffalo. A comprehensive index covers the first three pages. This is followed by a very convenient telegraph code, which has been gotten up for use in ordering tinned plates and metals. The first six pages are devoted to illustrations of pure aluminum ware. This is a branch of manufacture into which the house has recently entered and in which they have already achieved a very prominent standing. The goods shown cover a great variety of articles for culinary purposes, but it is understood that they only form a beginning to what is expected to be in the future a very large line. The succeeding pages are devoted to specimens of straight stamped ware, shallow stamped ware, pieced tinware, with a special class made under the name of Ideal tinware. Under the head of japanned ware is a large line of goods of artistic patterns. Toilet ware is a line in which the firm show a special make of high-class goods. They also make a full line of water coolers. The galvanized iron ware comprises all sorts of articles usually made of galvanized iron, including water buckets, ash or garbage pails, washtubs, &c. Miscellaneous goods cover a variety of articles made of copper, tin plate, &c. Coal vases comprise a variety of beautiful patterns. Other goods shown consist of roasting and baking pans, egg poachers, oil cans, steel milk cans, creamery pail trimmings, grocers' and druggists' tinware, spice cans and miscellaneous boxes. Being large dealers in tin plates considerable space is given to imported and American bright and roofing

plates. In connection with this are shown representations of bundles of galvanized iron, common sheet iron, sheet steel, Russia iron, &c. General tinners' stock comprises 21 pages. Furnace fittings and stove furniture occupy 17 pages. A complete list of granite iron ware occupies a considerable portion of the catalogue. This is followed by gray mottled enameled steel ware, a large line of coffee and tea pots and metal novelties of a varied character. Lanterns, lamps, oil stoves and gas stoves occupy 13 pages. Kitchen tools, such as lemon squeezers, can openers, ice shavers, &c., are shown in great variety. Considerable space is given to ice cream freezers, refrigerators, coffee mills, clothes wringers, ironing boards, &c. A specialty of this house is the manufacture of bird cages, of which an unusually large variety is shown. Timmen's tools and machines occupy the last 16 pages of the book and embrace all classes and kinds of tools used by tinners. The arrangement of the catalogue is admirable, the contents being easily referred to, and in this respect it reflects great credit on the compiler.

Perfection Coal Tongs.

The cut here shown represents coal tongs being introduced by the Cincinnati Tool Company, Cincinnati, Ohio,

Perfection Coal Tongs.

with New York office at 67 Reade street. The tongs are designed for handling bituminous coal in connection with grate fires and are made of malleable iron. It is explained that the action of lifting the coal closes the jaws, the weight coming upon the T-shaped slide; that the heavier the lump the easier it is handled, and that a child can use the tongs with ease. The total length of the tongs is 16 inches and they are furnished in Japan and in nickel.

We learn from a correspondent in London that work is progressing on the proposed heat and light exhibition which is to be held in that city. This exhibition comprises among its promoters several influential persons formerly connected with the naval exhibition. The site of the exhibition is a short distance from Kensington station and near Olympia, which will shortly be closed.

Arrangements have been made for formally opening the new Harlem Ship Canal on June 17.

STOVE TRADE NOTES.

The Cleveland Co-operative Stove Company

of Cleveland, Ohio, issue a 12-page pamphlet entitled "Something New Under The Sun." It relates to the twin burner air tight parlor heater which is being made under Baldwin's patent. The stove is handsomely decorated, nickel being judiciously employed in connection with the base, side rails, front and top. It is designed for burning hard coal, soft coal, coke or lignite, otherwise known as Dakota coal. The main bottom of the stove is provided with openings around and near the outside, but within the ornamental casing; also with openings connected with air ducts in the center. These receive the air from beneath the stove and allow it to pass upward, becoming highly heated in its progress, and is discharged into the room through openings in the ornamental casing at different heights, and also at the top. The ash base has two entirely separate doors, each provided with air tight draft openings quickly operated by a screw motion. At the top of the ash base are two distinct duplex grates, one over each ash pan. Above the main fire pot, which is oval in form, and connecting with it, are two compartments, dome shaped at the top, and provided with separate draft outlets. Each of these compartments has a feed door fitted with an air tight draft or check damper. The draft outlet of each compartment is opened and closed by a single reversible damper operated by a handle projecting in front near the top, and so arranged that when the draft outlet over one of the compartments is closed the other is opened. The fire pot and its connecting compartments are made of cast iron, very heavy and durable. The stove may be used as a double heater by simply removing the ornamental swing top, which discloses an open work cover arranged with a collar for receiving the pipe for the second story. In operating the stove the fire is started in the usual manner and the coal supplied through either or both the feed doors. After combustion is well under way in each of the lower fire chambers one of the upper chambers is filled about half way and the draft outlet damper in the opposite chamber is opened. When the fire in the chamber which has been partially filled is fairly burned through the main draft damper is reversed and the other chamber is filled, and then fuel is supplied to each chamber alternately, making sure always that the draft damper outlet is closed and the screw damper in the front door opened, as occasion may require, in the chamber last supplied with fuel. In order to keep the fire over night or for a longer period one chamber is left entirely filled with fresh fuel while the opposite chamber is only partially filled. All dampers and drafts are closed tight as well as the main draft outlet of the chamber last filled. The pamphlet which the company have issued shows a sectional view of the Twin Burner air tight heater, indicating the plan of construction. There is also given a copy of the application for patent by William W. Baldwin of the company. Extensive arrangements are being made to place this stove upon the mar-

ket in quantities, and the company are of the opinion that probably three-quarters of their foundry capacity will be turned upon this one stove before the season is over.

The Perry Stove Company

Upon the application of the trustees of the Perry Stove Company of Albany, N. Y., an application for a voluntary liquidation has been filed in the Supreme Court, and Judge Fursman has appointed Gen. Selden E. Marvin of Albany as receiver, who has taken possession of the affairs of the corporation. The receiver is authorized to continue the manufacturing and business without interruption, and with the complete stock on hand all orders can be filled with usual promptness. The stockholders of the Perry Stove Company held their annual meeting last week, and decided that the condition and the prospects of the company made it undesirable to continue the business longer on its present basis.

The company was originally started six years ago with a capital stock which has proved inadequate for the prosecution of its work on a scale large enough to be profitable, and in the depressed conditions of business that have existed it has not been found feasible to increase it. It has, therefore, been wisely decided to liquidate its affairs in a voluntary manner as provided by law, while its assets are amply sufficient to meet its obligations. With property which is valued at nearly three times the amount of its indebtedness, there is felt to be no doubt of its meeting its obligations in full; but as there must necessarily be time required to accomplish this, it seemed best to place the affairs of the company under the protection of the court, in order that its valuable assets might be preserved from needless impairment for the benefit of those to whom they belong. In the selection of Gen. Selden E. Marvin as receiver it is believed that this result will be insured and that every interest involved will be scrupulously guarded.

The plant on Van Rensselaer Island is well located and conveniently arranged. It is, of course, in the line of the receiver's duty to accept any advantageous offer he may receive for the plant, and he will no doubt do so, although the expectation is that it will be run for the present without interruption. An opportunity is thus afforded for getting possession of a stove plant with capacity of from 4000 to 5000 tons annually, and carrying with it the name and prestige of one of the oldest houses in the trade.

The new building which is being put up by Terstegge, Gohmann & Company of Louisville, Ky., will be of brick, and cover an area 131 x 60 feet. It will be three stories in height, of slow burning mill construction, and is expected to be completed in about two months. The first floor will be used for finishing and mounting rooms and the second and third stories for storage purposes. The new building will have an hydraulic elevator which will serve not only the new structure, but also the company's brick warehouse adjoining, as it will be located

just between the two. The elevator and the staircase will be separated from both buildings by a wall, and communication with either will be had only through fire doors. The company shut down their foundry on June 11 for the purpose of removing the old structures on the site occupied by the new building.

Regulation of Current in the Plating Room.

The improved rheostat shown in the accompanying cut, and which is manufactured by the Hanson & Van Winkle Company, 219-221 Market street, Newark, N. J., is adapted for the smallest current and tanks up to the largest current and surfaces.

As is well known, different voltages are employed to operate different solutions. It is required of the electroplating dynamo that a voltage sufficiently great be generated to do the work in a solution that is of the high-

Rheostat for Regulating Current in Plating Room.

est resistance, and at the same time, deposit in low resistance solutions. Then, again, the voltage has to be great enough to overcome the resistance of the conductors to the various tanks, which frequently is unnecessarily great. The tank nearest the dynamo, with the customary method, receives the most current, and the tendency to burn and blacken is noticed in a marked degree. When metals such as silver and copper are to be deposited in connection with such metals as nickel and brass, requiring a higher electromotive force, a considerable drop in voltage is demanded in the lower resistance solutions, so as not to blacken the work. With the ordinary style of resistance board, it is pointed out, this is done at a great loss of current and work capacity of tank. When a tank is being filled with work, with the improved rheostat and circuit, the current can be entirely cut off, or partially left on, as may be desired. When the tank is full the current can be switched on, and with this rheostat sufficient current can be conveyed to the work in the fastest manner. With the old resistance boards it is said about the greatest carrying capacity that they will feed is from 25 to 35 amperes, and never over 35 amperes, the reason for this deficiency being the smallness of the resistance wires, in-

sufficient metal conductivity, combustible material for backing, &c. It is necessary to have some resistance in the circuit so as not to blacken the work. With the improved rheostat, three times the current can be conveyed without showing heat in the least in any part of the same, the resistance wires, segments, switch or base plate. If, with the old style resistance boards, more than 35 amperes are to be carried, the wire gets too hot, warps out of shape, and burns out the back or base board, which is of wood or other combustible material, blues over and melts out segments, &c. With the improved rheostat, it is claimed, all this is overcome, it being constructed upon scientific principles, the large, heavy copper segments having great carrying capacity, with a most solid switch held against segments, and heavy, strong spiral springs, firmly held down with the two nuts, all mounted upon a cast iron base plate and insulated entirely with non-combustible material. This rheostat is claimed by the manufacturers to have exceptionally great carrying capacity, it having at the same time sufficient length of wire to allow of tuning down the highest electromotive force used in electroplating to the lowest degree that is ever called for without showing heat or any unfavorable symptoms. It is further claimed that by the use of this rheostat any plating room using two or more tanks can be doubled in capacity, provided the dynamo has current capacity. These rheostats are manufactured in three sizes, with various resistance in each size, suitable for all classes of work; so that they may be used in controlling the shunt field of the dynamos manufactured by the same company, or for resistance on tanks of different capacities, and for controlling main line currents. They are, it is said, used equally well in the field of the dynamo, by means of which the voltage may be reduced from 5 or 6 volts to 1 or 2 volts, for such work as electrolytizing from an acid solution of copper, &c., avoiding an unnecessary consumption of power. The Hanson & Van Winkle Company, we understand, are willing to send a sample rheostat on approval to responsible parties, on being advised as to the size tank or use for which it may be required.

ODD PLATES.

JUDSON A. GOODRICH, who has for some years managed the business of the American Radiator Company in New York City, has purchased of the estate of the late A. C. Barstow of Providence R. I., a large block of the stock in the Barstow Stove Company, and has been elected manager to represent that company in New York City, where his labors will commence August 1, when he will be glad to welcome his old friends and the trade in general. The company's offices and showrooms are located at 228 Water street, where they exhibit a full line of the well known Bay State stoves and ranges.

THE Cincinnati Heating & Ventilating Company, Cincinnati, Ohio, is the title of a newly incorporated concern, having a paid up capital of \$50,000, and engaged in the production and installation of warm air heating and ventilating apparatus in private and public institutions, hotels, residences, &c. The officers of the company are H. P. Deuschler, president; S. H. Small, vice-president; H. H. Lippelman, treasurer, and J. W. Johnson, secretary; who with L. E. Jordan form the Board of Directors. Mr. Jordan has for years been engaged in mechanical pursuits, and is said to pos-

sess a thorough knowledge of the principles involved in heating and ventilation. All the officers of the company have had long experience at the business. The shops of the company are located at Hamilton, Ohio, 25 miles from Cincinnati, and are conveniently connected with the Cincinnati, Hamilton & Dayton and the Pittsburgh, Chicago & St. Louis railroads. For the present, three sizes of the portable style of furnace will be made, but these by a system of combination can, it is claimed, be made to produce any desired heating capacity. For public work two sizes will be made, which can also be combined when necessary. The conveniences and practical principles involved in their construction, it is stated, will assure for them an undoubted success. All goods put out by the company will be under the one general title Ideal.

THE O'Connor Furnace & Range Company of St. Louis, Mo., have filed articles of incorporation. The capital stock is placed at \$10,000. The incorporators are H. C. Thompson, H. W. Curtin, D. J. O'Connor and E. J. O'Connor. The company will manufacture heating apparatus, house furnishing goods, &c.

JOHN J. GRAVES of Buffalo, N. Y., has been granted a patent for a parlor heater in which the hot air flues are claimed to be arranged upon an improved plan. The stove consists essentially of two casings, the inner of which forms the combustion chamber while the outer one is ornamented to give the stove a pleasing appearance. The hot air flues are arranged between the outer and inner casings, and through them the air is passed and heated. In the rear of the stove is a projection of the outer casing intended to support a vessel containing water. In order to properly direct the heated air in its upward passage through the flue or flues between the outer and inner casings so that it should be most efficient in heating the water vessel, a deflecting plate is provided a short distance below the top of the projection. The plate is so inclined that the heated air has to pass in nearly a horizontal direction immediately below the top of the projection, after which the air escapes into the upper portion of the flue, and then passes out into the apartment through openings provided for the purpose. The interest of Mr. Graves in this patent has been assigned to Sherman S. Jewett & Co. of Buffalo, N. Y.

THE Gem City Stove Mfg. Company of Quincy, Ill., have issued a poster illustrating the American Gem and the National Gem six-hole ranges, provided, among other features, with square ovens. The stoves are of handsome ornamentation, substantial appearance and embody the modern improvements. The manufacturers make a point of the large ovens, handsome appearance and satisfactory operation of these stoves. The company are also distributing an illustrated circular of Wynn's Black Silk stove polish and White Silk cream metal polish, for which they are Western agents.

TERSTEGGE, GOMMANN & Co. of Louisville, Ky., are bringing out two new heating stoves as well as a new coal stove. They have also made a number of changes in their steel ranges.

"PLEASANT HOMES" is the title of a 140-page volume of convenient size for reference which reaches us from the Anshutz-Bradberry Company, Pittsburgh, Pa. It is printed in two colors and bound in neat covers colored a deep blue with silver letters. The text is made up of a number of suggestions

respecting warm air, steam and water apparatus, together with tables of dimensions, capacities, &c., prepared with special reference to the Tremont all steel and iron and steel smoke, soot and gas consuming furnace, steam and hot water boilers. Many of the illustrations consist of buildings, both public and private, which have been heated with the company's goods. Some of the broken views of heaters are printed in colors, with red indicating the fire and the course of the products of combustion. A few pages are devoted to the Perfect Tremont six-hole range, made in three sizes, and to the Tremont steel plate range, made for hard coal, soft coal, wood or gas. A long list of testimonial letters is also presented, showing the satisfaction which the company's goods have given to those who have practically demonstrated their merits.

THE Clark Stove Company, Kansas City, Mo., manufacturers of the Clark steel range, are preparing to move into their recently completed factory, and expect to be in operation by July 1. The building is 68 x 350 feet, two stories in height, and built entirely of brick. The works will have a capacity of 40 ranges per day, which can be increased to 75 ranges should the business warrant it.

THE Detroit Stove Works of Detroit, Mich., received on June 12 a letter from a customer in Oshkosh, Wis., stating that on June 8 he sold and shipped a Home Jewel cook stove destined for Sidon, Syria. It appears that a person from Oshkosh is going home to Syria to live, and as there are no stoves in that country he decided to take one along with him.

WE are indebted to Fred E. Lee, manager of the Estate of P. D. Beckwith, Dowagiac, Mich., for a copy of a neatly printed pamphlet which they are distributing this year as an advertising novelty. With regard to the general make up and mechanical execution it is only necessary to say that it is from the press of Gies & Co., Buffalo, N. Y. The covers are executed in imitation of water color, the front bearing the title "A Good Thing From Doe-Wah-Jack," while the back cover is embellished with an illustration of a mounted horseman gazing at a quaintly fashioned sign which reads: "See the name on the leg. Round Oak Heating Stoves Sold Here." Beneath the picture are the words, which apparently express the sentiments of the rider: "Well, well; 1895, and the Round Oak still in the lead." The pages within the covers are devoted to a brief history of the Round Oak heating stove, together with an enumeration of its merits and constructive features. The central engravings occupy facing pages, one representing the common way of removing ashes from a stove, accompanied by clouds of dirt and smoke, while the other picture shows the cleanly method employed in connection with a Round Oak heater. In referring to this point, the manufacturers state that by their method of removing the ashes the little dust that arises is drawn back into the stove owing to the small draft or ash pit door, which concentrates the full power of the chimney upon this small space, made small for the purpose of minimizing the possible leakage of air below the fire. This feature is referred to as the one which has made the Round Oak stove famous.

SILVER & Co., manufacturers of household novelties, Brooklyn, N. Y., are experiencing a very excellent demand for their Brooklyn oil stoves this season. The firm have adopted the name of Brooklyn for the entire line

of gas and oil stoves of their manufacture. The company's factory, at 304-314 Hewes street, which has been recently enlarged to meet their growing business, has been running full in every department. A good demand is also reported for Silver & Co.'s extensive line of aluminum household ware and novelties, to which several additions have been made recently.

The Girard Stove & Foundry Company are busily engaged in tearing down their shops at Girard, Ohio, for the purpose of moving them to their new location at Youngstown. The company will erect at once a new warehouse and mounting room 40 x 100 feet in plan and three stories in height. They have added to their assortment of goods a new line of wood stoves and anticipate a good fall trade.

The S. Obermayer Company of Eighteenth and Rockwell streets, Chicago, Ill., are distributing a postal card calling attention to their foundry facings and foundry supplies. The statement is made that they carry a very large and complete stock, and that a catalogue and special circulars will be sent on application to those interested.

F. H. MOORE of the Howard Furnace Company, Syracuse, N. Y., met T. P. Healey, manager of their Boston house, at the New York office, 210 Water street, this week. Both report business in Howard furnaces on the increase.

The Canadian Nickel Mines.

The mines at Sudbury, in the northern part of the Province of Ontario, turned out more nickel last year than in any previous year, but, after all, that is not saying a great deal. The official figures are as follows:

Ore raised.....	112,637 tons.
Ore smelted.....	87,916 tons.
Ordinary matte.....	10,410 tons.
Bessemerized matte.....	1,470 tons.
Nickel contents.....	2,570½ tons.
Copper contents.....	2,748 tons.
Cobalt contents.....	3¼ tons.
Value of nickel.....	\$612,724
Value of copper.....	\$495,750
Value of cobalt.....	\$1,500
Number of men employed off and on.....	655
Wages paid.....	\$811,719

There are five mining companies at work on seven locations. Since operations began in 1888 the nickel contents of the ore smelted have amounted to about 10,000 tons, the copper to about the same. All the matte is shipped to the United States and Europe, where the nickel, copper and cobalt are extracted from it in the forms required for commercial use. The selling price at Sudbury of the metal contents was as follows in 1894: Nickel, per ton, \$238.36; copper, per ton, \$71.23, and cobalt, per ton, \$461.54. The average price of refined nickel in England in 1894 was about 36½ cents, Canadian and American currency, per pound. In 1876 refined nickel was worth \$2.60 per pound in the United States. The price fell on the opening in 1878 of the mines in the French colony of New Caledonia, and the development at Sudbury has further reduced it. Thus far, however, the Canadian mine owners have not made as much money as they expected to make.

In consequence of many complaints which have been received from time to time at the Navy Department from persons who have been obliged to live aboard United States war vessels, regarding the lack of proper ventilation in those ships, an inquiry into the subject is now being made by the Navy

Department. It is contended by many naval officers that the devices for increasing the circulation of air on board have either failed or are generally unreliable. Under present conditions, in the majority of naval vessels, if the wind happens to be in the direction in which the ship is steaming, it frequently occurs that the ventilation below deck is utterly inadequate. The navy medical officers have repeatedly asked that some improvement on this condition of things shall be introduced. They say that, in some ships, even in the quarters where the sick are placed, the supply of fresh air is not at all sufficient. The board of experts now sitting will, it is expected, soon present a report pointing out where the present faults in ventilation can be remedied

readily replaced by chasers cutting any style or pitch of thread, either right or left. The vise is self centering and is actuated by rack and pinion to feed the pipe into the chasers. Three sizes of this machine are built, one with a range of from 1 to 4 inches, one with a range of from 1 to 6 inches, and the machine as illustrated, with a range of from 2½ to 8 inches. As no lead screw is used with this machine any style or pitch of thread can be cut that is desired.

By means of a recent French improvement, the process of galvanic bronzing is said to have been made not only more simple, but capable also of giving every tone, from that of bar-

THE MERRELL PIPE MACHINE.

and suggesting methods by which this may be done.

The Merrell Pipe Machine.

The combined hand and power pipe threading and cutting machine designed and built by the Merrell Mfg. Company of Toledo, Ohio, is mounted on a base and driven by compound gears with cone pulley, and is so arranged that either hand or power can be used at will, or the machine can be readily taken from its base and used as a regular portable hand machine. The machine illustrated has a range of from 2½ to 8 inches. There are six chasers with this machine, which are set by graduation to any size desired, and are released from threading while in motion, opened to permit the pipe to be cut off and closed instantly and positively. One set of chasers is used to thread several sizes of pipe. They can be sharpened by grinding and are

bedian bronze, to antique green, governed by the length of time that the copper is allowed to remain in contact with the liquid. After the piece has been well scoured it is covered by means of a brush with a mixture composed of 20 parts of castor oil, 80 of alcohol and 40 parts each of soft soap and water. Thus treated, the piece left to itself for a period of 24 hours becomes bronzed, and if the duration of contact be prolonged the tone changes, a very great variety of tones, pleasing in their appearance, being obtainable in this manner. The drying is finally effected with hot sawdust, the only remaining operation being then that of coating the piece with a colorless varnish largely diluted with alcohol, thus insuring work of the finest character.

A war has begun among the anthracite coal producing companies. The Lehigh Valley and Reading lines have both begun to work full time during the current week.

TRADE REPORT.

The Iron Market.

The rush in the trade continues and has been gaining headway during the past week at a rate which is beginning to frighten some of the more conservative. To men who have been starving so long a timid lecture on the evils of glutony is not very impressive.

The one single article which breaks the cheerful monotony of advances in price is Coke, in which a merry war seems again imminent. Some one has taken away somebody else's pet customer and swift retribution has followed. Contracts have been made at lower price, and the echo of the threatened advance to \$1.50 has died away.

The rolling mills are very busy throughout the country, and the demand is heavy, although no very large individual transactions have cropped up. The Western Bar manufacturers have raised their prices \$1 per ton and their Eastern colleagues have followed suit with 0.1c. per lb.

The makers of Foundry Iron have jumped another 50c. a ton in all parts of the country. The leading Western distributing points report a very active week, Chicago in particular claiming to have beaten its own record in the volume of sales.

Pig Iron.—At a meeting in Philadelphia of the furnace managers of the Lehigh and Schuylkill Valleys, a further advance of 50 cents per ton in the price of Pig Iron was agreed to. The Southern furnaces announced a further advance of 50 cents a ton late last week. Business in the New York market has been fairly active, and although buyers are more inclined to resist the latest advance they are making further purchases. We quote #13 for No. 1; #12 for No. 2, and #11.50 to #11.75 for No. 2 Plain, Northern brands, tidewater delivery. Southern Iron, same delivery, is selling at #12.50 to #12.75 for No. 1; #12 to #12.25 for No. 2; #11.60 to #11.75 for No. 3; #11.75 to #12 for No. 3 Soft, and #12 to #12.25 for No. 1 Soft. Foundry No. 4 (Foundry Forge) is \$11.25 to \$11.50.

The Philadelphia Pig Iron market is very strong, and under a heavy demand prices have an upward tendency. At an informal meeting of the Eastern trade held at Philadelphia this week it was agreed that prices should be advanced 50c. per ton, but as their quotations have varied so much in the past, it leaves the actual selling prices as indefinite as ever; \$11.75 for No. 2 Foundry is probably a very inside figure, and there is no reason why prices should not be better, as there is plenty of business and only a very moderate amount of stock to draw from. Southern Irons are practically out of the market, and as a considerable addition to the output will be made by Eastern furnaces during the balance of the year, it is probable that consumers in this vicinity will depend to a greater extent than usual on the local supply. The general situation is very satisfactory to producers of Pig Iron, as there is every reason to expect a continued

good demand at improving prices. General quotations for Philadelphia and vicinity are about as follows:

Standard No. 1 Foundry X.....	\$12.75 to \$13.25
Standard No. 2 Foundry X.....	11.75 to 12.00
No. 2 Plain.....	11.25 to 11.50

Unusually heavy sales have been made of local Coke Iron in the Chicago market. The advance in prices brought in a fresh crop of buyers, as had been anticipated. Large consumers who had been deferring their purchases finally made up their minds that higher prices were here to stay and covered their requirements well into the future. Seldom, if ever, has there been a week of greater sales in the Chicago Pig Iron trade. The enormous business, as might be expected, led to another advance and prices are now marked up 50c. Agents of Southern furnace companies report a fair business at the prices prevailing last week and an additional 50c. was added on Monday. Quotations are as follows, for cash:

Lake Superior Charcoal.....	\$13.00 to \$13.50
Local Coke Foundry, No. 1.....	11.50 to 12.00
Local Coke Foundry, No. 2.....	11.25 to 11.50
Local Coke Foundry, No. 3.....	10.75 to 11.00
Local Scotch No. 1.....	11.50 to 12.00
Ohio Strong Softeners, No. 1.....	13.00 to 13.25
Southern Silvery, No. 1.....	12.75 to 13.25
Southern Silvery, No. 2.....	12.25 to 12.75
Southern Coke, No. 2.....	11.50 to 11.75
Southern Coke, No. 3.....	11.25 to 11.50
Southern, No. 1 Soft.....	11.50 to 11.75
Southern, No. 2 Soft.....	11.25 to 11.50
Alabama Car Wheel.....	18.00 to 17.00
Jackson County Silvery.....	15.00 to 15.50
Other Ohio Silvery.....	14.25 to 14.50

The Pittsburgh market is very firm and iron is hard to obtain, some of the Valley furnaces declining to quote, while others have no iron to spare this side of September. Several of Valley furnaces now on Foundry will go on Bessemer within a few days. All indications point to higher prices. We quote as follows:

No. 1 Foundry.....	\$11.25 to \$11.50
No. 2 Foundry.....	10.75 to 11.00

The Iron trade in the Cincinnati district continues full of vitality and buoyancy. Large sales of Pig Iron are being made, and prices are advancing rapidly. The latest interesting information is another advance of 50c. per ton on the Southern product, and an irregular rise on the Northern metal. It is not strange that the market has advanced so rapidly when the conditions which prevail are taken into account. It is reported that stocks at furnaces other than those which work their own Pig are little more than a two weeks' supply, and that the active stocks are already working at full capacity, while the increased consumption creates an active and increasing demand. It is further stated that the idle furnaces in the South—that is, the modern equipped plants—are so bound by local conditions that they cannot be brought into the market until a further material advance in prices has been established. The buying of Pig during the past week has been well distributed among foundries, mills and agricultural works. In the aggregate sales have been unusually heavy, one local house booking orders for 9000 tons in one day, the largest single transaction of which was 2000 tons. The price of fuel Coke, it is

stated, will be advanced on the first of next month. Quotations are given as follows:

Southern Coke, No. 1.....	\$11.00
Southern Coke, No. 2.....	10.50
Southern Coke, No. 3.....	10.25
Southern Coke, No. 1 Soft.....	10.25
Southern Coke, No. 2 Soft.....	10.25
Ohio Soft Stone Coal, No. 1.....	14.50 to 15.00
Ohio Soft Stone Coal, No. 2.....	14.00 to 14.50
Lake Superior Coke, No. 1.....	12.50
Lake Superior Coke, No. 2.....	10.75 to 11.50
Tennessee Charcoal, No. 1.....	14.00 to 14.25
Tennessee Charcoal, No. 2.....	13.00 to 13.50

The St. Louis market continues to show steady and decided improvement. The sales are heavier and inquiries received indicate an increased demand very shortly. Prices have been again advanced, this time scoring 50c., making No. 2 Foundry \$8.25, f.o.b. Birmingham, or \$11 St. Louis. The market is in excellent condition. The recent advance made in Northern Irons has encouraged Southern producers to maintain full prices and offers of orders for less than the prices quoted below are refused. Consumers are endeavoring to make contracts for their supplies for the balance of the year, but are not encouraged to do this by the furnacemen, as the outlook is very promising and still higher prices are anticipated. We quote as follows, for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry.....	\$11.50 to \$11.75
Southern Coke, No. 2 Foundry.....	11.00 to 12.25
Southern Coke, No. 3 Foundry.....	10.75 to 11.00
No. 1 Soft.....	11.00 to 12.25
No. 2 Soft.....	10.75 to 11.00

Metal Market.

Pig Tin.—At the opening of the week prices were carried upward for prompt and current month delivery. There was not enough buying interest, however, to hold the market against a moderate selling pressure and prices receded again. On the decline dealings were larger, and there seemed to have been more tin for sale at the lowest prices than there was at the highest point. Outside of speculative circles considerable tin has been moved on old contracts and more recent purchases, but liberal arrivals have prevented any diminution in stocks at first hands. Straits shipments during the first half of June were quite large, including 450 tons to the United States, 1600 tons to England and 540 tons to the Continent. Some improvement is noted in the demand from consumers and out-of-town dealers. Small lots of Straits Pig from store are quoted at 15½c. to 15¾c. per lb.

Copper.—The leading mining companies have not retreated from their former position. At all events they profess to stand out firmly for late highest prices, and in some instances claim to be unable to fill orders requiring delivery this month or next. One Lake company reports having recently sold 1,000,000 pounds at 10½c. for Autumn delivery, and that price is the one generally asked. However, enough Lake Copper has come out from on e source or other to disturb values on spot delivery, several sales having been made at about ½c. lower. Electrolytic and casting stock have also eased off

somewhat. Jobbers' prices for Lake Ingot in moderate sized lots are 11c. to 11½c., and for G. M. B. 10½c. to 10¾c. per lb. The statistics of May production, showing the largest output for any month thus far this year, have doubtless had some influence in the direction of causing some uneasiness, particularly among holders who can realize a good margin of profit in selling at the lowest price above quoted.

The monthly production of Copper in the United States has been as follows, according to John Stanton, the first column giving the aggregate returns from the reporting mines, which include the principal Lake, Montana and Arizona producers; the second, being the metal from pyrites and from a number of smaller outside sources, being estimated:

American Product.			
	Reporting mines. Gross tons.	Outside sources. Gross tons.	Total. Gross tons.
Second half 1892.....	59,239	6,287	65,526
First half 1893.....	62,470	6,478	68,938
Second half 1893.....	67,290	6,252	73,542
First half 1894.....	186,129,760	12,730	142,480
Second half 1894.....	73,951	8,640	81,991
Totals 1894,193,543	17,080		139,623
1895.			
January.....	10,094	1,600	11,694
February.....	11,120	1,600	12,720
March.....	12,553	1,600	14,153
April.....	11,944	1,600	13,544
May.....	13,260	1,600	14,860

Sheet Copper.—The improvement noted in the demand for Manufactured Copper last week has not quite kept up to the higher level during the week just ended, but the falling off is regarded as merely temporary. In fact, the latter days of the week already developed a better run of orders than those with which the week opened. A marked tendency is noted on the part of consumers toward a desire for placing orders for deliveries extending into the latter months of the year. Evidently the expectation of higher prices is responsible for this feature. Manufacturers are not, however, inclined to contract far ahead at the present rates, the expectation being that prices will be advanced on all lines of Manufactured Copper and Brass in the near future. Cornice copper moves freely, and a very large demand from the building trade is looked for in the coming months. Small lots of Sheet Copper from store are quoted at the net price of 14c. per lb.

Pig Lead.—Demand has been very moderate throughout the week and prices have declined a fraction. The center of weakness was lower prices in London and consequent poor prospect for the liberal export movement that has been more or less confidently expected for some time past. With foreign outlet probabilities less encouraging Newark is looked upon as a formidable factor in the home market, and Western producers, rather than hold the umbrella, have sought trade at the expense of concessions. Consequently prices for Common Western have weakened a fraction.

Spelter.—This metal has been somewhat affected by the weakness in other lines, despite the strong statistical position at producing points and the opinion, quite freely expressed of late, that Spelter was beyond the influence of outside conditions. Comparatively

few sales have been made here during the week, and purchases in the West by galvanizers have fallen off also. Nevertheless consumption in the aggregate is fairly large and prices maintain their firmness. In small jobbing parcels good brands of Western Spelter fetch 4c. to 4¼c. per lb.

Antimony.—Business has been of a routine type, moderate all told and mainly at former prices. quotations ruling are 9c. for Cookson's and 8c. for Hallett's, in small lots.

Nickel.—Sellers' quotations are 35c. to 40c., according to quantity and terms.

Tin Plate.—The leading feature of the week in the Tin Plate market has been a remarkable stimulation in the demand for Coke Plates for near future shipment. The movement is due to the increasing requirements of the canning trade, which are considerably above expectations, added to which the threatened strike among Welsh Tin Plate workers, together with tardy deliveries by American makers, have caused a difficulty in having orders accepted for any deliveries prior to September. The stocks of Foreign Cokes in hand are unusually small. These circumstances have brought about a rise of from 5 to 7½c. per box for both foreign and domestic Cokes. The oil men are reported to have placed orders for at least 40,000 boxes IC 14 x 20 for future delivery, at a considerable advance over the current rates. Retail business in both Bright and Roofing Plates has also been rather more active, and prices are firmer all along the line.

A special London cable dispatch of June 19 to *The Iron Age*, reports on the British Tin Plate market as follows: Tin Plate is much firmer and prices on the average are 8½c. dearer. A large quantity of spot Cokes has been sold at top prices. Buyers are eager for more at the figures, but makers ask higher rates owing to threatened strike of workmen. More orders have been taken for Roofing Plates for America, and there is still a good demand. There is improved demand for Black Plates at £7 12s. 6d. to £7 15s., f.o.b. Wales. Tin Plate quotations, f.o.b. Wales, are as follows:

Bessemer Cokes, IC 14 x 20, 9s. 6d. to 9s. 7½d.
 Siemens Cokes, IC 14 x 20, 9s. 9d. to 9s. 10½d.
 Ternes, 20 x 28, ... 18s. to 22s. 6d.
 Charcoals, IC 14 x 20, ... 11s. to 13s. 6d.

Sheet Iron.—The mills are so crowded with work that some of them are refusing to take orders for shipment before September. Buyers have considerable difficulty in finding mills to take any business at all. The demand for Galvanized Sheets continues heavy, and the price has again advanced during the week to the highest point known in some years. Small or moderate sized quantities from store are quoted at 70 per cent. off. No 27 Common Iron in small lots rules at 3c. per lb. Black Plates for thinning purposes are firmer in price, and prompt shipments of this material are as difficult to obtain as are those for other descriptions of Sheet Iron.

The R. & B. Mfg. Company, Philadelphia, who make electrical specialties, are putting on the market a new vibrating push button which causes a slight noise at the button when the bell at the other end of the wire is ringing, enabling the person who presses the button to know that the bell is ringing. The advantage of this feature of the button has already brought many orders to the company.

Chicago Report.

Scrap.—A very heavy business is now being done. Dealers quote their buying prices as follows, Chicago delivery:

	Per net ton.	Per lb.
No. 1 Wrought Scrap.....	\$7.50	8.00
Machinery Cast.....	6.00	6.50
Malleable Cast.....	6.00	6.50

LALANCE & GROSJEAN MFG. COMPANY, 19 Cliff street, New York, have recently made some considerable shipments of Enamelled Ware in response to orders from Valparaiso and Buenos Ayres. They report that the demand for this class of goods in the Argentine Republic and in the South American States generally is growing rapidly since the financial and political atmosphere in those countries has cleared.

THE ROME, N. Y., BRASS & COPPER COMPANY have elected the following directors: Willey J. P. Kingsley, Harmon G. Utley, Allen M. Wardwell, Daniel G. Dorrance, William R. Huntington, Thomas H. Stryker, Jonathan S. Haselton, John G. Bissell and Christopher C. Reid. The officers are: President, W. R. Huntington; vice-president, W. J. P. Kingsley. Executive Committee: W. R. Huntington, W. J. P. Kingsley, H. G. Utley, J. S. Haselton.

JOHN WOOD & BROS. COMPANY and the Alan Wood Company, manufacturers of sheet iron and steel, Conshohocken, Pa., have voluntarily notified their employees that, on and after July 1, their wages will be increased 12 per cent. This increase affects about 1000 workmen.

CONDITION OF THE Hardware Trade.

A FIRM and confident tone characterizes the market, some further advances having been made in the prices of goods in which the raw material is an important part of the cost. In some lines of general Hardware there is a disposition on the part of manufacturers to withdraw some of their extreme prices and in general to pursue a conservative course, and some of them are refusing to book heavy orders for future delivery at the lowest prices now ruling. Conferences in regard to several lines are progressing, and it is not unlikely that advances in at least some of them may result. Careful and conservative men are watching the course of things closely, to see whether or not the advances made will be maintained, and are looking with some apprehension on the disposition which is manifested in some quarters to advance prices too rapidly, with the probability of a reaction, sooner or later, which would have an injurious influence on the market. The effect of the summer dullness is looked for with much interest, as the market if sustained during the quiet months will be full of promise for the fall.

Advices from Chicago.—The Hardware trade, especially that of manufacturers' agents, is favorably affected by a severe cut recently made in freight rates to the West and Southwest. Notice of restoration of rates has been given, so that only a limited time will prevail in which to take advantage of low rates, which will of course lead to active buying during the remaining time. Apart from this condition the Hardware trade holds up unusually well for the time of the year. The demand is of a general character, with scarcely any speculative buying in staple goods. These are being taken simply to cover the requirements of the trade, and no question is now heard as to the stability of higher prices. Manufacturers are withdrawing quotations on general Hardware and jobbers look for a material advance all along the line at an early day. Tin Plate is active but prices are unchanged.

Notes on Prices.

Wire Nails.—During the past week Wire Nails have continued in excellent demand, orders coming in much beyond the capacity of the mills to execute them, and the manufacturers are refusing to accept orders on any terms for delivery after June 30. Small lots from store in New York are regularly quoted at \$1.55 base, and from dock, \$1.51. The market is so bare of goods that prices are to a good extent nominal, and any mills which are in a position to ship promptly could readily obtain an advance on the carload price. The manufacturers were in conference this week in Pittsburgh. As a result of the meeting the price of Wire Nails for July delivery has been advanced to \$1.50 per keg, in carload lots. In 1000 keg lots taken out during July a rebate of 10 cents per keg will be made. Concerns represented at the meeting state that they are crowded with orders and have no Wire Nails to sell for June delivery and some of them have very few to spare for July delivery.

Advices from Chicago.—The demand is unabated, but factories are full of work for June and can take no more orders. Inquiries are coming in for July. The purchase of the Baackes Wire Nail

plant at Cleveland by the Consolidated Steel & Wire Company is regarded here as a very valuable acquisition by that company. It gives them another outlet at a very important trade center. Most jobbers have advanced prices on small lots to \$1.50, although some still sell at \$1.40.

Cut Nails.—The condition of the Cut Nail market is similar to that of Wire Nails. Small lots from store in New York are held at \$1.40 base. There is, however, difficulty in obtaining Nails, and the trade generally are anticipating an advance, notwithstanding the fact that the prices of the Cut Nails are closely approximating those of Wire Nails.

Advices from Chicago.—Manufacturers report a strong demand with the local factory well sold up for June. Quotations are not yet out for July. Jobbers quote small lots from stock at \$1.25.

Barb Wire.—The Barb Wire market continues strong and with an upward tendency. The demand is exceptionally heavy for the season.

Advices from Chicago.—Manufacturers are having an extraordinary demand for the time of the year. Usually the demand is cut off very sharply in the early part of June, but trade is still in full tide. The cut in freight rates to the West and Southwest is expected to have a decidedly stimulating effect on this business for the next week or so. Jobbers' quotations on small lots vary from \$1.65 to \$1.80 on Painted and \$2 to \$2.15 on Galvanized, some of them being quite conservative in following up advances.

Garbage Can.—Sidney Shepard & Co., Buffalo, N. Y., who are putting on the market the Sanitary Garbage Can described in our last issue, are selling it to the trade at \$13 per dozen for the 14-inch and \$24 for the 18 inch, subject to a discount of 50 per cent.

Watering Pot.—The Standard Watering Pot, described in our issue, June 1, as put on the market by the Cleveland Stamping & Tool Company, Cleveland, Ohio, is sold to the trade from the following list, which is subject to a discount of 20 per cent.:

	8 qt.	10 qt.	12 qt.	14 qt.	16 qt.
Per doz.	\$7.20	9.00	10.00	12.00	14.00

Bolts.—The following are the advanced prices recently adopted by the manufacturers of Carriage and Machine Bolts, Bolt Ends, &c.:

	Per cent.
Machine Bolts with H. P. Nuts.....	75 and 7½
" " C. P. C. and T.....	70 and 15
" " Nuts.....	70 and 15
Machine Bolt Blanks.....	75 and 2½
Coach Screws G. P.....	80, 10 and 5
Lag " ".....	80, 10 and 7½
Skein " ".....	80, 10 and 5
Bolt Ends, H. P. Nuts.....	80 and 2½
" " C. and T. Nuts, H. P. or C. P.....	80
Tap Bolts and Set Screws.....	65
Carriage Bolts.....	70, 10 and 5

Nuts.—An advance of about 4-10 cent per pound has been made by the manufacturers of hot pressed Nuts. The market is in excellent condition and characterized by a firm tone.

Glass.—The demand for Window Glass continues fair, absorbing, it is stated, more than is at present being produced. It is understood that stocks in manufacturers' hands vary in size, some factories having shipped Glass as rapidly as it has been made, while others have carried a portion of their entire production during the fire. The

market is reported as being firmer than at any time during the season of 1894-95, and that the shading of the prices which went into effect May 1 is exceptional. From statistics it is learned that the importation of Window Glass for April of the present year, compared with that of the corresponding month of 1894, shows a decrease in pounds approximately equal to 36,488 boxes. Present quotations of American Window Glass are on the following basis: Less than 100 boxes, 75 and 5 per cent. discount; car lots, 75 and 10 per cent., and 1000 boxes, 75 and 10 and 5 per cent. discount, the discounts applying to the list adopted May 1, 1895.

Wrought Iron Pipe.—The successive advances which have taken place are well maintained and the market has a firm tone. The volume of business is large. The manufacturers are refusing orders for future delivery. Official prices are quoted as below, but actual business is done at higher figures, orders being hard to place:

	Discount per cent.
Black Pipe, ¼ to 1½ inches.....	67½
Galvanized Pipe, ¼ to 1½ inches.....	62½
Black Pipe, 1½ inches and larger.....	75
Galvanized Pipe, 1½ inches and larger.....	65

Iron and Brass Fittings.—The manufacturers of Fittings for Steam, Water and Gas report the market in excellent condition, with an upward tendency. Several slight advances have recently been made, and the higher prices now ruling are referred to as well maintained. Some of the manufacturers have withdrawn all quotations and are refusing to book orders for future delivery.

Tire and Stove Bolts.—In accordance with the advance recently made by the manufacturers of Tire and Stove Bolts the published price of these goods is now 70 per cent. discount instead of 70 and 10 per cent. as heretofore.

White Lead.—Business has been fully as brisk as it was during the preceding week. Small orders have, in fact, been more numerous, and those for good sized lots make a gratifying total. The rumor still has circulation that corrodors intend to advance prices next month, but nothing definite as to intentions can be learned at the proper source. That the market is in good shape cannot be questioned, and there seems to be nothing in the way of an advance in prices apart from the possibility of attracting more foreign Lead to this side.

Red Lead.—The market for foreign iron. Arrivals have been heavier in delivery on former contracts and a very fair amount of new business has also been consummated. Domestic brands are unchanged in price, but meet with better sale. Several good sized lots were taken for delivery this month, and there is a fair degree of interest in later deliveries.

Old Metals.—The consuetive demand in this line, both for Scrap Iron and other Old Metals, has become quite large. Some considerable purchases of Scrap, Copper and Brass have been made during the week. One lot of about 1,000,000 pounds was bought by a large dealer in this city, of which 400,000 pounds has been taken for export to Liverpool and Italy. Stocks of Scrap Iron are becoming low, and holders who have been standing out for higher prices have been able to obtain the figures they demanded. Prices on Old Metals remain firm at last week's quotations, with an upward tendency. Wrought Scrap Iron fetches from 50c. to 75c. a ton more than a week ago.

The following quotations represent dealers' purchasing prices for moderate sized lots, New York City delivery:

Heavy Copper.....	lb 73¢	¢
Light and Tinned Copper.....	lb 71¢	¢
Heavy Brass.....	lb 5¢	¢
Light Brass.....	lb 4¢	¢
Lead.....	lb 3¢	¢
Tea Lead.....	lb 25¢	¢
Zinc.....	lb 9½¢	¢
No. 1 Pewter.....	lb 4½¢	¢
No. 2 Pewter.....	lb 4½¢	¢
Wrought Scrap Iron, gross ton.....	\$8.75	@ \$9.00
Heavy Cast Scrap..... gross ton.....	\$8.50	@ 9.00
Stove Plate Scrap, gross ton.....	\$8.00	@ 6.50
Burnt Iron..... gross ton.....	5.00	

Old Rags, Paper, &c.—The market is fairly brisk for Paper Stock of all kinds, and the outlook is regarded as promising. Prices, while not notably higher, are very firm. Dealers' purchasing prices, New York City delivery, rule about as follows:

No. 1 White Rags.....	lb 3	@ 3½¢
No. 2 White Rags.....	lb 2½	@ 2½¢
Mixed Rags.....	lb ½	@ 1¢
Blues and 3ds.....	lb 1	@ 1½¢
Hard Sized White Shavings.....	lb 2½	@ 2½¢
No. 1 White Book Shavings.....	lb 1½	@ 2½¢
No. 2 White Book Shavings.....	lb 1	@ 1½¢
Light Book Shavings.....	lb 1	@ 1½¢
No. 1 Mixed Shavings.....	lb ½	@ 1¢
No. 2 Mixed Shavings.....	lb ½	@ ¾¢
No. 1 Printed Books.....	lb 1	@ 1½¢
Ordinary Mixed Books.....	lb ½	@ ¾¢
Newspapers.....	lb ½	@ ¾¢
No. 1 Manila Paper.....	lb ½	@ 1¢
No. 2 Manila Paper.....	lb ½	@ ¾¢
Bogus Paper.....	lb ½	@ ¾¢
Common Paper.....	lb ½	@ ¾¢
Straw Chips.....	lb ¼	@ ¾¢
Binders' Clippings.....	lb 1½	@ 1½¢
Jute Butts.....	lb 1½	@ 1½¢
No. 1 Jute Bagging.....	lb ½	@ 1¢
Mixed Bagging.....	lb ½	@ ¾¢
No. 2 Bagging.....	lb ½	@ ¾¢
Hemp Twine.....	lb 2	@ 2½¢
Manila Rope.....	lb 2	@ 2½¢
Jute Rope.....	lb 1½	@ 1½¢
Mixed Rope.....	lb ½	@ ¾¢

Old Rubber.—The following quotations represent about the current prices paid by New York dealers:

Car Springs, ton lots, lb. 3	@ 3½¢
Rubber Shoes, carloads, delivered at factory, lb.	4½¢
Rubber Shoes, less than carloads, lb.	4½¢
White Wringer Rolls, lb.	3½¢
White Syringes, lb.	3½¢

Trade Notes.

THE WALKER LEAD COMPANY of St. Louis, Mo., with a capital stock of \$80,000, have recently filed articles of incorporation. The incorporators are I. N. Walker, A. B. Walker, H. A. Thompson and Earl Thompson.

A BIG TIN CAN FACTORY is to be started at Elwood, Ind., by Eastern capitalists. The plant is expected to be in operation this year.

THE WHITAKER BRASS FOUNDRY COMPANY, Kokomo Ind., are doubling the capacity of their plant and will put on an increased force of men.

IN another column D. R. McCallum, 69 Centre street, New York, calls attention to a desirable salesroom and warehouse space which he will share with a good steam specialty house. The location is right in the midst of the heating trade in New York City.

THE WELLS RUSTLESS IRON COMPANY's plant, about three miles from Hackensack, N. J., has been destroyed by fire and the damage will probably be nearly \$10,000.

THE SUTTON BRASS MFG. COMPANY of Buffalo, N. Y., have been licensed to incorporate. The president is Harry C. Green, and the directors are Edwin L. French, A. H. Plante, George Plante and J. W. Sutton.

THE NEW BRITAIN BRASS COMPANY, New Britain, Conn., have commenced work on their new factory.

THE CALIFORNIA WIRE CLOTH COMPANY, San Francisco, Cal., have been incorporated, with the following directors: A. S. Hallidie, Victor Engineer, Frank L. Brown, B. Seales, W. A. Grubb. The capital stock is \$25,000.

THE WIRE GOODS COMPANY, Worcester, Mass., are intending to materially enlarge their plant. The extension will probably double their present floor space.

F. A. TAYLOR has purchased the Straight Mfg. Company's Brass Works, at Kalamazoo, Mich., and will build a new plant.

New Publications.

MOTIVE POWERS AND THEIR PRACTICAL SELECTION, By Reginald Bolton. Size, 7½ x 5½ inches; 257 pages. Published by Loughmans, Green & Co, 1895. Price, \$2.25.

There has been a distinct advance made in recent years by engineering periodicals in considering the question of cost in connection with engineering work and the reasons, economic as well as structural, which determine the methods and forms used. Prices are quoted, and methods and designs discussed, not from a structural standpoint alone, but from considerations of first costs and earning capacity. Little of this spirit, however, has invaded the Engineering text-books and especially has this been lacking in the books on the steam engine and similar works in Mechanical Engineering. In the work before us the author gives full tables of cost of the different motive powers and necessary fittings which are remarkably close to the cost of good machinery in this country. In some cases his figures are a little higher than average prices here, as in the case of the prices given for horizontal return tubular boilers. They are on the safe side, however, and are about what would have to be paid where more than usual care is taken, by means of rigid specifications, to secure the best material possible. The discussion of the principles involved in the selection of the best form of motive power is most excellent; one cannot help wishing, however, that it had been made fuller and more thoroughly illustrated by means of examples. The Engineer in practice will find some rather serious errors and omissions, as for instance, on page 11 where the coal per minute per horsepower is given as from ½ pound with ordinary coal and machinery to ¾ pound for the best coal and machinery. The subject of the variation of efficiency of turbines at different gates seem to have been almost entirely overlooked. One cannot agree fully with the statement that the locomotive type of boiler is the best for burning wood when such excellent results are obtained with boilers set in brick. The following will seem strange to many Mechanical Engineers. "All rivet holes to be drilled, those in the shell to be drilled after the shell has been bent and bolted in position." But as a whole the book is one which no Engineer can afford to do without; for the young Engineer and in technical schools the book, if used as the author evidently intends it should be used, will be invaluable.

Dispatches from Russia indicate that the crops of Russian cereals promise remarkably well, and are almost equal to the large crops of 1890.

The Sheet and Tin Plate Wage Scales.

As was generally expected the respective wage scales for sheet iron and for tin and black plate mills for the year ending June 30, 1896, has been arranged without difficulty, to the satisfaction of all parties concerned. The new sheet scale is based upon the average selling price of sheets, the minimum price being $2\frac{1}{2}$ cents per pound, instead of upon the price of bar iron, as under the old agreement. The workmen are to receive 2 per cent. of the increase in every 10 per cent. advance in the price. This settlement affects about 20,000 workmen. In the case of the tin and black plate workmen the new scale is similarly based upon the selling price of 100 pounds IC tin plate, instead of, as heretofore, upon the bar iron card. The skilled workers will be paid as a minimum the same wages as last season, but the scale does not touch unskilled tin mill labor, as it formerly did. Some 12,000 men are affected by this arrangement. The expectation seems to be general that a speedy advance in the prices of tin plates will occur, in consequence of the increased cost of bars and of the steel sheets rolled from them. Sheet iron has already advanced materially in price.

School Room Air.

This expression, so frequently employed as indicative of the atmospheric condition of unventilated school rooms, is seldom comprehended in the fullness of its meaning. School room air under such conditions is more than merely malodorous, more than close and oppressive; it is absolutely dangerous to the health of those who breathe it. In such a continuously occupied room with insufficient means for the renewal of air, the danger lies not in the abundance of carbonic acid gas produced by respiration, for this gas in itself, there is reason to believe, is neutral, so far as its effect on the

human system is concerned. But fortunately its presence, as determined by comparatively simple means, is an index of the relative proportion of other and injurious gases, as well as micro-organisms among which are to be found disease germs. As is well known, the presence of carbonic acid gas in excess of 8 parts in 10,000 parts of air creates a feeling of oppression and weariness on the part of those who are confined in such an atmosphere. But such a degree of contamination is as nothing when compared with the conditions as shown by expert tests in many schools. Where the ventilating system is found insufficient it is not uncommon to discover from 20 to 30 parts of carbonic acid gas in 10,000 parts of air, while in those buildings in which no provision has been made for ventilation the proportion has not infrequently been found to run as high as 50 parts. Certainly no one would wish to bathe in the water another has just used, nor take food from another's mouth, and yet this is substantially what is done in a poorly ventilated apartment. The air fouled and polluted by contact with the person and by respiration is passed on to the next in only a partially diluted state.

Disease Germs.

But it is far more than a matter of cleanliness; it is a matter of healthfulness. Critical study has shown beyond all question that injurious effects result from continued breathing of polluted air. The science of germ growth and the propagation of disease germs is now well understood. While such germs are practically lacking in the open air, they are found in increasing quantities as the air becomes polluted by the presence of human beings, as in inclosed apartments, and their effective action as conveyors of contagious diseases is well known. It must be evident that just so far as the germs given off from unhealthy bodies and distributed in the atmosphere may be the process of dilution be lessened in relative quantity per cubic foot of air breathed, to this degree may the dangers of contagion be likewise lessened. Ventilation can thus be clearly seen to be merely a process of dilution. Polluted water may be diluted to such a degree by the admixture of pure water as to be rendered harmless, and so may the air vitiated both by respiration and by the exhalations from the skin be so intermingled with fresh air as to lose its harmful effects. Lack of accurate and authentic records of the disastrous effects of poor and the beneficent results from good ventilation has had much to do with a failure to realize the conditions as they exist. The action of vitiated air is by no means immediate; its ef-

fect is slow but none the less sure. It does not, like a violent poison, bespeak its character and its harmfulness at once, but, like the sparkling but nevertheless tainted water, it saps the vitality of its victim. It is subtle, its effects are not readily traceable to their cause, but, notwithstanding, nothing is more certain than that improvement in school house ventilation will increase the bodily health and mental vigor of the pupils, will decrease the expense for substitute teachers and will to an appreciable degree reduce the time necessary to acquire an education. Time is money, in this instance, and it cannot be better expended than in the improvement of school house ventilation.

The General Society of Mechanics and Tradesmen of the city of New York has just issued its annual report for 1894, being the 110th year of its existence. The intimate connection of the society with the New York Trades School is well known, a number of its directors being on committees of that school. It maintains a number of free scholarships, in the New York Trades School, sixteen such scholarships having been awarded to pupils last year. Of these, six were for carpentry, four for plumbing, two for bricklaying, and one each for blacksmithing, stone cutting, house painting and fresco painting. The society itself maintains a free library, containing over 100,000 books; and its reading rooms are free to all respectable persons. That this privilege is appreciated is proved by the fact that during 1894 65,273 persons used the reading room. The schools and classes of the society give free instruction in mechanics, stenography and typewriting to men and women. It maintains also a course of lectures on scientific and popular subjects. Moreover, it affords pecuniary aid to, and cares for, widows and orphans of mechanics and tradesmen who are entitled to its assistance.

The decided improvement in crop news has tended to put backbone into every branch of business. The latest trade reports published by the commercial agencies are uniformly encouraging. Prices are advancing in all lines and larger forces are being employed in nearly every industry, while a number of concerns which have been long idle are making active preparations for early resumption.

Robert Speir Bussing, for many years senior member of the metal manufacturing firm of Bussing, Crocker & Dodge, Brooklyn, died on June 21, at his home, 20 Garden place, Brooklyn, at the age of 69 years.

THE LETTER BOX.

Tinning Black Iron.

From J. W. H., *Whittinsville, Mass.*—In further explanation of my letter, which was printed in *The Metal Worker* of June 15, I would say that my idea is to take common No. 16 R G sheet iron, cut it into pieces to form a 50-inch circle and tin it after it is cut. I would like to know what substance to use for tinning so as to get the best results.

Note.—Our correspondent has asked a rather difficult question. It would be possible, of course, to explain how sheet iron should be cleaned, pickled and tinned; but we would warn our correspondent that he is attempting a good deal of an undertaking. To merely tell him what acids to use in pickling, and to add that the tin must be melted and the cleaned iron dipped in it would give him very inadequate information. If he really wants to go into the tinning business it would be well for him to have his tinning pots and works put in operation by an expert; for it is practically impossible for him to start off with no knowledge of the business and acquire all the fine points of the art of tinning. It is delicate work and one who has not learned the business cannot make a success until he has spent a great deal of time and money in experimenting. The plant, furthermore, for the purpose our correspondent mentions, would cost a considerable amount of money, and we judge from his letter that he only wants to do tinning to a very limited amount. In that event it would be much cheaper to have the tinning done by some one already in the business.

Economizing Chimney Heat

From M. N., *Pennsylvania.*—I wish to economize the chimney heat, or in other words save that which is ordinarily wasted, and propose to run a 7-inch smoke pipe up through the building and use old range boilers as heating drums on each floor, there being four floors in the building where I wish to use this device. Will such an arrangement interfere with the draft so as to prevent satisfactory operation of the stoves? Is a 7-inch round pipe equal to an 8 x 8 chimney flue for use in connection with stoves?

Note.—We shall be glad to have our readers express themselves in reference to this subject. It is a common custom to use a sheet iron heating drum in the chamber above the kitchen in country houses. These drums vary in size; but taking a drum 2 feet in diameter and 3 feet in height as an example, it would expose about 20 square feet of heating surface. The material of which it was made would facilitate the rapid transmission of the heat from the smoke to the apartment. When a good fire is burning in the stove in con-

nection with such a drum, they are very efficient as heaters. A 30-gallon boiler would expose a somewhat smaller amount of heating surface, and being made of very much heavier material would not transmit its heat so rapidly; and it is doubtful if placed in a room it would be as satisfactory as a drum of lighter material. If these drums, however, are placed in rooms on the same floor as and adjoining those in which the stoves are used, and the pipe connection is made in the 7-inch stack under each boiler, it is probable that a fair degree of efficiency would be attained in rooms of the average size. It is hardly probable that a 7-inch pipe would equal an 8 x 8 flue in draft capacity.

Loss of Pressure by Bends.

From C. A., *South Carolina.*—I send herewith a rough sketch of the way in which a boiler is connected

with an engine. The pipe rises from the boiler about 2 1/2 to 3 feet; then elbows off, shooting to the factory wall 78 feet away, then alongside the wall 2 1/2 feet; then rises 7 feet 9 1/2 inches; then through the wall and to a point over the steam chest of engine 6 feet 10 inches; then elbows down 6 feet 6 inches, to the steam chest. I wish to know if by swinging elbow A and C as indicated by the dotted lines there would not be a great saving of steam, fuel, &c., and if there is any way to compute about what saving there would be. As it is the steam has a great many angles to turn before it reaches the engine. The pipe from elbow A to C is on the same level. How would it do to raise the elbow A to a level with elbow D and shoot straight to the factory?

Answer.—The saving of steam in pipe transmission by the reduction of length and elbows is very important, and with exact data as to size of pipe and engine, its speed, point of cut-off and steam pressure, may be very closely computed the value of coal consumed for such waste. The amount of protection from felting the pipe and protecting the part exposed to the weather is also important in the assignment of values. All of these points are left out by our correspondent; hence we can only give an ap-

proximate value in length of pipe that will be saved by the suggested changes. The formula for an elbow is

$$1 + \frac{76}{\left(\frac{3.6}{\text{diam. of pipe}}\right)} =$$

loss in diameter in length of pipe. To clearly illustrate this, say, for a 4-inch

pipe; then $1 + \left(\frac{76}{\frac{3.6}{4}}\right) = 40$ diameters, and as 4 inches is $\frac{1}{3}$ foot $\frac{40}{3} = 13.3$ feet

of pipe will be saved or its equivalent loss of friction saved for each elbow that can be dispensed with. By changing the pipe to the diagonal position a saving equal to $19 + 13.3 = 32.3$ feet, and if the pipes are raised so as to do away with the second elbow, then $32.3 + 13.3 = 45.6$ feet of pipe, will represent the relative saving from the total friction surface of the steam pipe from the boiler to the engine. Then, counting

the total length of pipe and adding 13.3 feet for each elbow equals 192 feet, and $\frac{45.6}{192} = 23.7$ per cent. of the steam friction will be saved by shortening the pipe and leaving out two elbows. This as a percentage looks large, but it is only comparative, for if our correspondent should take an indicator card of the engine pressure and find 4 pounds less initial pressure upon the card than the boiler pressure, then the actual loss of initial piston pressure will be $0.237 \times 4 = 0.948$ pound, and if the engine is running at 80 pounds boiler pressure and the engine cuts off at $\frac{3}{8}$ the mean engine pressure will be 0.76 of the initial pressure, and $0.948 \times 0.76 = 0.72$ pound will be the mean engine pressure per square inch of piston. To carry the point to a value in horsepower we will have to assume an engine with a cylinder 14 inches diameter, 18 inches stroke, making 150 revolutions per minute. Then $\frac{153.9 \times 0.72 \times 450}{33,000} = 1.51$ horse-power lost in friction of extra length of steam pipe and elbows. If our correspondent is burning 6 pounds of coal per hour per horsepower 90 pounds of coal per day of ten hours will represent the coal loss.

Dimensions of Ventilators.

From J. H., New York.—Will *The Metal Worker* or some of its readers please give me some rule for obtaining the dimensions of the two ventilators of which sketches are inclosed. In Fig. 1 how large should the top A B be for an 8-inch pipe and how far from C to D; also, how far below the top of pipe C should the rim A B extend to keep out rain or snow. In Fig. 2 how large should the top be from A' to B' to keep out the weather

Dimensions of Ventilators.—Fig. 1.—Section of Ventilator with Rim.

and how much space from C' to E'. I would like to know if the pitch of top A' D' B' makes any difference.

Answer.—Some time ago we presented a side view of an Emerson ventilator which was supposed to have been drawn after the original design. Following that model, if the sides A B, Fig. 1, were used, the diameter could be twice that of the pipe, and it would be well to have the lower edge of rim A B on a line with or slightly below the top of pipe. This would give ample space between C and D. In Fig. 2 the diameter A' B' should be twice that of

Fig. 2.—Section of Ventilator with Pitched Top.

the pipe C' and from C' to E' one-half the diameter of pipe. We should be glad to have a further discussion of the subject by our readers.

Life of Steam and Hot Water Pipe.

From J. K., Norristown, Pa.—I should like to hear from the readers of *The Metal Worker* as to the relative life of piping used in connection with steam and hot water heating plants.

Riveting Iron Pipe.

From J. K. L., Weeping Water, Neb.—I notice in *The Metal Worker*, of May 25 a communication from "W. B." of Chicago giving his experience in riveting iron pipe joints, such as

Riveting Iron Pipe.—Fig. 1.—Fastener Attached to Pipe.

smoke pipes are generally made with. If he and others interested will, however, use the split bolt pipe fastener shown in the accompanying illustrations, I think they will find it much more convenient than the ordinary

Fig. 2.—Fastener Opened.

rivet, as it can be inserted from the outside of the pipe or any other hollow work, such as galvanized iron cornice, cylinders or drums, by punching or drilling the holes, or in light work by making the holes with an ordinary

Fig. 3.—Fastener Closed.

scratch awl. Fig. 1 shows the fastener attached to two joints of pipe, Figs. 2 and 3 are two views of the fastener attached, while Fig. 4 is an ordinary nut that goes on the shank of the fastener. The fastener can be

Fig. 4.—Nut for Securing Fastener.

taken out by removing the nut, which admits of its being used over and over again.

Tarred Paper Under Roofing Tin.

From Roofer, Milwaukee.—Referring to the letter from "A. S.," Paris, Ill., in *The Metal Worker*, June 15, it seems to me that as coal tar is injurious to tin it must be evident that paper or felt saturated with coal tar would injure the tin placed over it. Some roofers consider ordinary building paper the proper material to place under tin, as it has a tendency to prevent condensation, yet in case there should be a leak in the roof will allow the water to soak through. Others prefer a paper saturated with rosin, which makes it water proof and would prevent the moisture from below from reaching the tin. Whenever rosin paper is used under a tin roof it should be laid so the water will run against the lap. This can be done by laying the first sheet at the eaves, then slipping the edge of the second sheet under the first, and so on. When the paper is laid in this manner any water which may enter through a leak will not flow the length of the roof between the tin and paper, but will drip out at the

first lap. A felting or paper that does not contain anything injurious to tin, is also water proof and a non-conductor of heat, would be a desirable article to place between the sheathing boards and the tin of a roof, thus preventing condensation.

From N. H. & C. W., New Haven, Ky.—In reply to "A. S.," Paris, Ill., whose inquiry appears in *The Metal Worker*, June 15, we would say that our experience with tarred paper under tin has not given the satisfactory results we looked for, so we now use for roofs over steam boilers, flour mills, &c., a water proof paper with paper above the tar, if any tar is used. For plain roofs, any common roofing paper will give satisfaction.

Who Should Make the Connections?

From E. M., New York.—I notice the inquiry of "X.," in *The Metal Worker* of June 22, as to who should make the connection between the water back and the horizontal boiler when these two articles are furnished by range contractors to the builder. A change of custom was inaugurated with the advent of the horizontal boiler in this market. The plumber in the past always made the boiler connections and continues to do so when an upright boiler is used. It has, however, grown to be an almost universal custom for the dealer who furnishes the range to adjust the pipes which connect the water back with the horizontal boiler. This custom is so strong that both the range dealer and the builder look upon the making of this connection as a part of the range dealer's contract.

Sheet Zinc for Eave Troughs and Conductors.

From C. N., Milwaukee.—Judging from the letter of "N. K. W.," in *The Metal Worker*, June 8, Stoneboro must have a large amount of sulphur in the air if tin or galvanized iron eave troughs and conductors will only last about two years. If the best roofing tin or galvanized iron were used, and the articles were kept well painted, it would seem that they should last much longer than the time mentioned. It is well known that sheet tin or galvanized iron have only a thin coating of metal, and if there is enough sulphur in the air to destroy this coating the iron or steel will last but a short time. It is claimed for iron roofs that they are durable, but it is supposed they are to be kept well painted so as to protect the iron from the action of the air or "smoke." Why should not tin, galvanized iron or zinc have the same protection where sulphur abounds?

Asphalt Floors.

From NEW HAVEN TIN, SHEET IRON & COPPER WORKS, New Haven, Ky.—Can you inform us how to lay an asphalt floor? We contemplate using an asphalt floor in our new store and shop and would like to know from actual experience if such a floor would give as satisfactory results as a wooden floor; also, how much would it cost per 100 square feet? Our object in using it is to make the buildings more nearly fire proof, as insurance rates are so high here.

Note.—We should be glad to have our readers furnish information on this topic. We understand that asphalt floors are excellent, but the general objection is the expense. We can, unfortunately, give no definite information on this point and should be much pleased if our readers could furnish it.

ROOFING AND CORNICE.

The Hang Up Drawing Board with Profile Slate.

A. L. Burtis, Lockport, N. Y., furnishes us the particulars of the application of his copyrighted elbow chart to the obtaining of miter patterns, which is intended to accomplish by a short and easy method the developing of miter patterns for every day shop use. This slate chart, with its useful scales of degrees, enables one to find the degree or angle wanted, and to draw the miter line instantly across the profile marked on the slate for any miter he may wish a pattern for, which is one important advantage over the usual method, and results, it is pointed out, in a great saving of time. Perhaps, in a shop where they have all the facilities

crosses the protractor E will indicate the proper degree, and on the vertical scale the mark to draw the line to. A line drawn from G' to a similar number or degree in the vertical scale I I' will give the corresponding miter line.

In Fig. 2 is presented the usual method for obtaining the pattern for an article that is a regular polygon in plan. The elevation is drawn above the plan, and lines dropped from the profile across the miter lines in plan, and from the points thus obtained lines are carried cutting the usual measuring lines drawn through the stretchout line. By the use of the slate shown in Fig. 1 the miter line can be obtained without drawing the plan or elevation. In Fig. 3 is shown the perspective view of a chimney top, which is a regular

tabulating points to place on the stretchout line. Thus on *lk* in Fig. 6 lay off a stretchout of the points in the profile K L, as indicated by the small figures. The paper being placed on the board, *lk* would be drawn parallel with the raised edge A A', which serves as a guide for the square in drawing the usual measuring lines. The measuring lines are then drawn, and the lengths of lines from G G', passing through the points in the profile K L to the miter line N O, transferred to lines of similar number drawn from the stretchout line *lk*. Thus the line corresponding to point 1 of profile is $6\frac{1}{2}$ inches long; the line corresponding to point 2 of profile is $6\frac{1}{2}$ inches, &c. Through the points thus obtained in the measuring lines trace a curved

The Hang Up Drawing Board with Profile Slate.—Fig. 1.—General View.

for drawing, this method might not be considered of so much value, but it is contended that very few shops are so provided, and this new system is intended for their benefit.

In Fig. 1, A A' B B' represents the board, which is 26 x 48 inches. C C' D D' is a slate, 16 x 20 inches, let in near the left hand end, and flush with the surface of the board. G G' H H' of slate is divided into inches and eighths, for obtaining the lengths of measuring lines. At E is placed a protractor for obtaining angles, and at I I' a corresponding vertical scale of degrees. The table of degrees at J, for producing polygons, is very useful, as it gives the right degree by which the miter line may be drawn from G' to the vertical scale I I', to form the desired shape for any molding, as an octagon, or ball in any number of pieces up to 12. The miter line for a round, elliptical or square elbow, of any number of pieces, can also be drawn. To ascertain the miter line for any other angle, place the bevel with one blade on G' H', the crotch being at point F, and where the other blade of the bevel

polygon in plan, and the patterns will be obtained for the top part K L and the base L M. In Fig. 4 is presented a partial elevation of the top, showing the profiles of K L and L M. When it is desired to obtain the pattern for an article having mitered corners, the profile of which is formed of curved or straight lines, it is best to cut a profile out of tin, which is of use to form the work by, and from that the profile may be drawn on the slate, as shown by K L and L M of Fig. 5, where a portion of the slate is shown larger than in Fig. 1. Then ascertain what the angle of the miter line is by the protractor. If for a square, or article having four sides, table J shows the miter line to be 90 degrees, or a line drawn from G' to I'. As this line would not be convenient to use in connection with the profiles in Fig. 5, lines can be drawn parallel to it, as shown by N O and N' O'. The patterns shown in Figs. 6 and 7 are obtained as if the paper was secured on the board at the right of the slate.

Then to obtain the pattern for K L of Fig. 5, space off the curved line, es-

line, as shown by I' K', thus completing the pattern. The pattern for base L' M' of Fig. 5 is obtained in a similar manner. On *lm* in Fig. 7 lay off a stretchout of L' M' of profile, as shown by the small figures in *lm*, and through the points thus obtained draw the usual measuring lines. Transfer the lengths of lines from G G' to miter line N' O' that pass through the points in profile L' M' to similar lines drawn from *lm* of Fig. 7. Lines traced through these points of intersection, as shown by *lm'*, will complete the pattern.

In Fig. 8, let T U U' represent the half profile of a ball which is to be made in 12 pieces. Also let R S R' S' represent a portion of the slate on which the profile is drawn. Referring to table J in Fig. 1, we see that the angle for the miter line for an article of 12 sides is 30 degrees. Accordingly the miter line would be drawn from G' to 30 in the vertical scale I I'. This line is shown in Fig. 8 by Q P. Then divide U T of profile into any convenient number of parts, as indicated by the small figures. On

ut of Fig. 9 lay off a stretchout of U T, and draw the usual measuring lines. Take the lengths of lines between R S and P Q that pass through points in the profile U T, and transfer to lines of similar number drawn from u t, and through the points thus obtained trace a line, as shown by c b. From the point b draw b a, parallel with t u, and make a d equal to a c. Using c b as a pattern, mark d b. Or, measuring in each instance from a b, make the points in a d b equal to those on similar lines in a c b. Then d b c is the half pattern for a ball of 12

sired miter line. Accordingly a line drawn from G' to 45 on I I would give this miter line. This line is shown in Fig. 10 by X W. Then divide the profile Y Z into any convenient number of parts, and on y z in Fig. 11 lay out a stretchout of profile Y Z, as shown by the small figures. Through the points in y z draw the usual measuring lines. As in the previous instance, take the length of lines between V W and X W that pass through points in the profile Y Z, and transfer to lines of similar number drawn from y z. Through the points thus obtained trace

FLASHINGS.

THE Illinois Roofing Supply Company, 203 Lake street, Chicago, Ill., issue a handsomely colored official price list under date of June 15, 1895. The folder is printed in blue and red, making a very striking effect, and on the front page is a picture of a cottage covered with Perfection lock seam steel roofing. The two inner pages quote prices on sheet metals, roofing plates, bright plates, eave troughs, conductor pipes, roofing, siding, &c.

THE Berger Mfg. Company, Canton, Ohio, issue a supplement to their architectural sheet metal catalogue, which is a handsome pamphlet measuring 15 x 12 inches in size and bound in tinted paper. The pages, which are numbered from 65 to 90, relate to cornices, urns, finials, hip caps, dome finials, dormers, ornamental ridging, artistic ridge and hip moldings, hip molding terminals, cresting blocks, letters and figures, druggists' sign mortars, spun balusters, gable ornaments, &c. The size of the pamphlet enables large illustrations to be used, which present the sheet metal articles with exceptional clearness, showing all the details of ornamentation, &c. With the illustrations are particulars of sizes, &c.; also numbers for ordering. The letters and figures shown in two styles are made in various sizes from 6 to 12 inches.

THE Roanoke Roofing & Metal Cornice Company, Roanoke, Va., have secured the contract for furnishing the galvanized iron work in the Masonic Temple, which is being erected at Bedford City, Va. They also are doing the sheet metal work for store buildings at Charlottesville, Va.

C. H. LUM, New Haven, Conn., says the *Commercial Record*, has secured the contract for the slate roof on the new car house of the New Haven Street Railway Company. Mr. Lum has contracts for slating a number of houses, and has recently ordered six carloads of slate. He has fitted up a factory and office at West Haven, which will be connected by telephone, and where he will manufacture and ship his roofing cement and sheathing papers.

GEORGE A. OHL of George A. Ohl & Co., Newark, N. J., sailed for Germany last Wednesday, to be gone three months. It is some time since Mr. Ohl visited the Fatherland, and all will join us in wishing that his trip will be full of rest and pleasure.

W. H. RANKIN, 91 Maiden lane, New York, issues a small 16-page illustrated pamphlet descriptive of his brand of patent painted felt for sheathing slate, shingle or tin roofs; also patent painted roofing, Empire sheathing and other specialties in roofing materials manufactured at his factory, at Elizabeth, N. J. The pamphlet also contains extensive directions for applying the felt and tarred roofing. Mr. Rankin reports a very satisfactory volume of business in his line since the opening of the year. His factory is now busy on the manufacture of stock for the fall trade, the outlook for which he considers to be remarkably favorable.

A TASTEFUL little booklet with the title "Enamelled Leather Sheathing" is issued by the Mica Roofing Company, 73 Maiden lane, New York. Its contents refer to the enamelled leather sheathing manufactured by the firm, which is described as a strong paper, enamelled in imitation of leather, for building purposes, rosin sized and water proof. The sheathing is claimed to offer an absolute protection from dampness and drafts,

Fig. 2.—Usual Method for Obtaining the Pattern of an Article that is Regular Polygon in Plan.

pieces. To obtain the miter line for an elbow of any angle, divide the number of degrees by one less than the number of pieces in the elbow. Then a four-piece elbow of 90 degrees would require three angles of 30 degrees each. As P Q represents a 30-degree angle in Fig. 1, c b of Fig. 9 represents one-fourth of the full pattern for a four-piece elbow of the diameter indicated by T U', which is 5 inches.

In Fig. 10, V W V' W' represents a portion of the slate, upon which is drawn the profile of an ogee, as shown by Y Z. If it were desired to obtain the pattern for an octagon angle, or article of eight sides, table J in Fig. 1 would indicate that 45 degrees in the vertical scale I I' would give the de-

a line, as shown by y' z', thus completing the pattern.

An advantage claimed for this system is that the same process obtains the pattern for all shapes and angles, thus simplifying the operation and leaving less to be remembered by the student or workman. Many may think the slate is too small, but it is large enough to accommodate almost any single member of an ordinary cornice or base. For a face or gable miter the profile would be placed the other way on the slate.

JOSEPH MARQUARDT has recently begun the cornice and roofing business at 149 Avenue A, New York City.

Among its recommendations is the fact that it will not mildew or decay, but will last as long as the build- phlet advertising the merits of their Medal brand of wire edge ready roofing, made of three layers of the best

Fig. 3.—Perspective View of Chimney Top for which Patterns are Required.

Fig. 6.—Pattern for Top.

Fig. 4.—Partial Elevation of Chimney Top.

Fig. 5.—Profiles Drawn on Slate Reduced in Size.

the water proof layer, are placed wires which give the material great strength and which form a lock joint or secure fastening at the laps, affording security against wind pressure. The Mica Roofing Company's factories in Brooklyn, N. Y., and Indianapolis, Ind., are reported to be running to their fullest capacity in order to fill the increasing volume of orders received during the past two months.

Two attractive illustrated pamphlets issued by the Childs Mfg. Company, 95 William street, New York, call attention respectively to the Childs water proof sheathing and building papers and the Childs preservative paints and insulating electrical compounds. Special mention is made in the first named pamphlet of the Safety lining paper, lined with asphalt, which is claimed to make a perfectly water proof article of great toughness and strength and practically indestructible. Childs preservative paints are described as being water, acid and alkali proof, and are recommended as preserving wood, brick, cement and iron from the action of these elements.

The New York World has printed a list of advances in wages in the last 30 days, showing that about 250,000 workmen have had increases ranging from 10 to 30 per cent.

At a special trial of a new electric motor, on the Nantasket branch of the New Haven Railroad last week, a speed of 80 miles an hour is reported to have been easily obtained. A hot box was all that prevented the making of a still higher rate of speed.

ing on which it is placed. The Mica Roofing Company also distribute an attractively gotten up 24-page pamphlet advertising the merits of their quality tarred felt, combined with two layers of water proof composition. In the edges of the roofing, imbedded in

**A Long Pull, A Strong Pull and
A Pull All Together.**

BY FOSSIL.

I have read that there are "sermons in stones and books in the running brooks," and as I sit surrounded by the "stones" which are indigenous to this section, with a river near answering for the "brooks," I will try to find

tend may say, "It is not in mortals to command success; but we'll do more, we'll deserve it," and in case of defeat they will endeavor to find out what errors they have made, and, if possible, improve former action.

Probably there are few who enter upon a business career without the intention of continuing it, unmarried females excepted; therefore "a long pull" is expected in the outset. A "strong pull" is also admitted to be

not a mere cog in the business wheel, but entitled, if worthy, to the care and consideration of the wage payer. Time was, before the words master and apprentice had fallen into desuetude, that a boy who set out to learn a trade would have a like attention given to his moral and physical welfare by his employer to that which he had presumably received from his parents. Likewise there was a time when such a boy felt bound to reciprocate by caring for

Fig. 7.—Pattern for Base

at least a text for this fossilized essay. By and by our river will be full of motor-craft propelled by all manner of motors, and full of gazing people, some of whom may perhaps be also "full," decorated from stem to stern—the vessels, not the people—with an eruption of bunting in which the blue of Yale and the scarlet of Harvard will be prominent. There will be a time of great expense, also, of by no means hushed suspense, as the rival crews pass "Mamackoe Point;" everybody asking everybody else—since the boats carry no sign of identity known to the general public—what college is leading. Down between the columns of steamers, yachts and other floatants they will go, reaching the goal amid the waving of flags, the booming of cannon and the shouts of the multitude. The race from start to finish is over in about twenty minutes, then the river is soon deserted by the contestants and spectators, and "silence like a poultice comes to heal the blows of sound."

Perhaps this is enough of a "pull" to moralize on, but there is more to follow. There was no one seen sculling occasionally but I suppose are practice pulls, or rehearsals, on the river. I watch—without caring who will "get there" on regatta day—the steady uniform sweep of the oars, the rhythmic motion of the rowers' bodies, the undeviating course and the apparent indifference to all sights and sounds except the voice of the "coach," who, from the accompanying launch, sometimes criticises forcibly.

Then I think, here is an aquatic sermon which ought to be reported for the possible improvement of possible readers. It teaches the value of individual attention to the business in hand; the need of combined and accordant effort to accomplish a result which is hoped for with a common desire; the submission for the general good of personal independence; to the direction of authority which holds power through the will of the subjects. "A long pull!" persistent effort. "A strong pull!" earnest effort. "A pull all together," combined effort. These qualities, which are necessary alike in athletic contests and business enterprises, may not always bring victory, but those who manfully con-

Fig. 8—Profile of Ball in 12 Pieces.—Dimensions on Slate are One-Half Size.

Fig. 11 — Pattern for Ogee.

Fig. 10.—Profile of Ogee, Octagon
in Plan.

Fig. 9.—Half Pattern for Ball.

very necessary in these days of competition. And this brings me to the point which I intended to reach with less words.

"A pull all together," it seems to me, is getting rather out of fashion in the case of employers and employees. For some reason they don't seem to be in the same boat, or at least they appear to use their "sculls" for contrary purposes. There was a time, when some other fossils may remember, when the workman—especially the apprentice—was

the master's interests equally with his own. If that kind of masters and apprentices were not extinct, we might expect a better agreement between capital and labor than now too often obtains.

The Keystone Pottery, owned and operated by Miller Bros., at Rochester, Pa., was destroyed by fire of unknown origin, on June 25. The plant was valued at \$50,000 and carried an insurance of \$30,000.

TIN PLATES.

The Tin Plate Scale Arranged.

After a three days' session in Pittsburgh last week the Conference Committee of the Iron and Steel Sheet Manufacturers' Association and the Amalgamated Association arranged a scale governing sheet and tin plate mills for the year ending June 30, 1896.

The tin and black plate mills scale, formerly based on the bar iron card, has been changed and is now based on the selling price of tin plate, as follows:

Base of Tin Plate Scale.

When 100 pounds 1C tin plate is selling at a ratio of one-fourth the price per ton of 2240 pounds of 4 x 4 steel billets, the wages list as in agreed scale shall prevail, but in case of a departure in either the selling price of steel billets or tin plate that will change the above ratio \$2 per ton, or more, then the wages list shall advance two per cent. for each \$2 from said ratio and decline two per cent. for each \$2 decline to said ratio, but in no event shall wages go below present list during the year beginning July 1, 1895, and ending June 30, 1896.

Gauge Nos.	Rolling steel 2240 lbs.	Doubling.	Heat-ing.	Shearing on jaw or crocodile shears, and job work on squaring shears.
8 to 11	\$2.04	\$0.93	\$0.85	
12, 14...	2.13	.96	.90	\$0.99
15, 17...	2.45	1.10	1.07	
16, 17...	3.24	1.46	1.32	
18 to 20	3.62	1.63	1.48	1.59
21 to 24	4.07	1.85	1.63	
25, 26...	4.57	2.07	1.88	
27, 28...	4.63	2.21	2.05	1.71
29, 30...	5.39	2.70	2.48	1.76
31...	5.40	2.84	2.66	1.78
32...	5.65	2.97	2.79	1.88
33...	5.99	3.13	2.88	1.98
34...	6.64	3.33	3.15	2.20
35...	6.97	3.32	3.34	2.30
36...	7.43	3.60	3.46	2.46
37...	7.62	3.65	3.52	2.49
38...	7.60	3.72	3.58	2.52

Black Plate Used for Tinning Only.

21 to 24	\$3.96	\$1.86	\$1.63	
25, 26...	4.00	1.86	1.69	\$1.52
27, 28...	4.41	1.96	1.82	
29, 30...	4.50	2.36	2.17	1.54
31...	4.59	2.48	2.34	1.65
32...	4.80	2.60	2.44	1.73
33...	5.06	2.74	2.62	1.73
34...	5.64	2.91	2.76	1.93
35...	5.92	3.08	2.92	2.01
36...	6.32	3.15	3.06	2.15
37...	6.39	3.19	3.08	2.18
38...	6.46	3.26	3.13	2.21

1. Thirteen per cent. less than at prices for iron, except shearmen.

2. Shearmen on modern squaring shears on twenty-five gauge and lighter to receive 87½ cents per turn. This clause only applies for shearing tin plate.

EXTRAS.

3. Twenty per cent. added for changed steel and twenty per cent. on net price of iron.

4. Seventeen per cent. added for pickle finished iron and steel, except shearmen.

5. For all sheets sheared into circles on tin and black plate mills where the loss exceeds ten per cent., twenty per cent. extra shall be paid.

6. That all sheets cut down to smaller sizes on tin and black plate mills be paid for at scale prices.

7. All sheets rolled on tin mills over fourteen square feet shall be paid for at sheet mill prices.

8. Where improved squaring shears are used, the company shall pay for grinding the knives.

9. Catchers on tin and black plate mills to receive twenty-three per cent. of roller's statement.

10. Eight hours shall be a day's work on tin and black plate mills.

OUTPUT.

The limit of a turn's work of eight hours shall be as follows:

On Gauge Nos.	100 pounds.
24	6,650
25	6,250
26	5,850
27	5,650
28	5,150
29	5,350
30	5,250
31	5,050
32	4,850
33	4,650
34	4,450

Where 28 gauge is worked, matched, 8 sheets to the pack, 5650 pounds shall be the limit.

Scale of Prices for Morewood Stacks.

	Tin-nng.	Wash-ing.	Catch-ing.
	Cents.	Cents.	Cents.
Coke	11	11	3½
Best coke	12	12	4
Charcoal	12	12	4
Double rolling	14	14	4
Heavy coating	12	12	4
Old style	15	15	4

Standard.—A box of 14 x 20 containing 112 sheets = 31,360 square inches to be the standard.

All boxes weighing over 136 pounds to be paid for as over weight.

In the above scale of prices for Morewood stacks prices for assorting were not finally agreed upon, but will be arranged by Mr. Jarrett for the manufacturers and Mr. Garland for the Amalgamated Association. After the scale governing sheet mills had been arranged, it was signed in conference by J. G. Battelle, president, and John Jarrett, secretary, for the firms belonging to the Iron and Steel Sheet Manufacturers' Association and is binding on them. The tin plate scale was signed in conference by W. T. Graham, president, and John Jarrett, secretary, and is binding on the members of the Tinned Plate Manufacturers' Association of the United States. The first tin plate concern, not a member of the above organization, to sign the tin plate scale was the Monongahela Tin Plate Company of Pittsburgh, who signed on Monday morning, the 24th inst. Other concerns are expected to sign within a few days.

Opinions of a Welsh-American Tin Plate Maker.

J. H. Rogers, managing partner of E. Morewood & Co., Llanelly, South Wales, and Gas City, Ind., who has recently returned to Wales from a visit to this country, was interviewed on arrival by a reporter of the *South Wales Daily News* in regard to the condition of the tin plate trade in America. Being asked whether the Welsh trade with the United States was falling off to the extent that was generally believed, Mr. Rogers replied that that was not his opinion. He considered it premature to say that any serious injury had so far been done to the tin plate trade in Wales by the progress of the industry in the United States. He also stated that

the report that sufficient plants had been laid down in America to meet all the wants of this country has been enormously exaggerated. Being asked by the reporter if he believed that Wales still had a firm hold on the American trade, Mr. Rogers diplomatically replied that he was of the opinion that "the larger portion of tin plates consumed in America come from Wales." How long this condition of affairs is likely to continue, however, he could not say. His attention being directed to the policy now being adopted by the Welsh tin plate workers for the restoration of the 1874 wage list, Mr. Rogers declared that that policy would be very difficult to realize; adding: "Every increase in the cost here makes it more easy for America to compete with Wales, as, so far, the make in the States is not nearly so large as their own consumption. The higher the cost here the more rapidly will the trade leave this country."

In regard to the question of new markets for the Welsh product Mr. Rogers said that he did not anticipate a material increase in the Welsh trade with the European continent, as the continental countries are becoming large makers of tin plates on their own account. The South American States, he thought, were likely to offer the best field for the Welsh tin plate manufacturers in the future, as they are becoming great farming and meat producing countries. The Japanese, he thought, are much more likely to manufacture tin plates than to consume them. Being asked for his views on the outlook for the Welsh trade, Mr. Rogers concluded as follows: "I consider the outlook better than it has been for the last two or three years, and I think that Wales will for a long time continue to be a large tin plate manufacturing district, especially as everybody seems to be working away at reducing the cost of production, and it is only by reducing the cost of production that we can hope to compete with other nations, and encourage the use of tin plate for the purposes in respect of which glass, wood and cardboard are at present employed. For instance, there can be no doubt that tin plates will this summer be used by many American establishments for canning fruit, instead of glass bottles, as the price of tin plates has been reduced, while the price of glass has risen. Furthermore, there appears to be a revival in trade all the world over, a revival by which England has so far been least affected. Every country in the world consumes tin plates, and as for America making all she requires for her own consumption, it is quite incorrect."

The new rolling mill of the Struthers Iron & Steel Company, Struthers, Ohio, was put in full operation last week. Since its acquisition by the present management, the plant has been completely overhauled, and new and improved machinery installed, a large annealing house and warehouse having also been erected. The works are said to have begun operations with sufficient orders to keep them busy until the fall. Another sheet mill will be put down before the close of the year.

SCRAP.

A NEW MILL has recently been completed by the Junction Iron & Steel Company, Mingo Junction, Ohio, for the manufacture of tin plate bars. The mill will have a capacity of 200 tons of soft steel bars a day.

LA BELLE IRON WORKS, Wheeling, W. Va., have contracted with the H. S. Sands Electrical Mfg. Company for the installation of an electric light and power plant in their newly completed tin plate works.

W. H. DONNER, manager of the National Tin Plate Works, Anderson, Ind., states that a test will be made of the new plant about July 15, when four of the mills will be ready for operation. The entire plant is expected to be at work by August 1.

NECESSARY repairs which have recently been carried out at the plant of the American Tin Plate Company, Elwood, Ind., have been completed; and the plant started into full operation on Monday, with the new rolls in the cold roll department.

THE mill of the Crescent Sheet & Tin Plate Company, Cleveland, Ohio, is now in full operation, so far as regards the black plate department. Four mills are running full time, together with the pickling, annealing and cold roll departments; and everything is reported to be working very satisfactorily. The firm do not propose equipping their tinning department for the present.

SHIPMENTS of black plates for tinning from Great Britain to the United States in the month of May, according to the Board of Trade returns, amounted to 300 tons, as compared with 1180 tons in April. The total shipments of black plates to this country during the first five months of the current year have been 4247 tons.

THE agreement which has been come to between the management and the workmen at the Dyffryn Tin Plate Works, Morriston, South Wales, involves a reduction of wages equal to 23½ per cent. Similar terms have been conceded by the men at the Landore Tin Plate Company's works, Swansea.

THE illustrated *Greater Cleveland* of June 15 contains portraits of President H. B. McIntosh, Secretary and Treasurer J. A. Mathews and Superintendent James Paton of the Crescent Sheet & Tin Plate Company, Cleveland, together with a description of the company's new and extensive plant, details regarding which have already been given to our readers.

THE Monongahela Tin Plate Company, Pittsburgh, Pa., have signed the Amalgamated Association wage scale for the season of 1895-1896, for their employees. The company are not connected with the Tinned Plate Manufacturers' Association, and their works were not included in the settlement made between the wage committees of the two associations last Saturday.

At a meeting of citizens interested in the projected new suburb of Connelville, Pa., George J. Humbert of Norristown, Pa., presented full details regarding the new tin plate works which the Connelville Extension Company propose to erect under his superintendence. The plant will consist of a four-mill tin plate works, modern and complete in every particular, to be erected at South Connelville, at a cost of not less than \$150,000. The buildings will be fire proof, of iron or brick and stone. The dimensions of the buildings will be about as follows: One iron building, 100 x 165 feet; one brick or stone building, 40 x 200 feet; one

iron building, 45 x 80 feet; one iron building, 60 x 100 feet. The work on this plant is to be commenced immediately on the signing of the agreement, whereby the people of Connelville and vicinity agree to purchase \$130,000 worth of lots in the new section. It is understood that these lots have nearly all been subscribed for, and the early prosecution of the enterprise is believed to be assured.

It is expected that the workmen at the Western Tin Plate Works, Llanelly, South Wales, will stand out for the restoration of the 1874 wage scale at the close of the present month. This decision they have communicated to the management as being final, and it is thought that the works will be closed in consequence. The men have hitherto been working on a reduction of 12½ per cent. on the 1874 list.

THE DEATH is ANNOUNCED of David Samuel of Llanelly, South Wales, a director of the Ashburnham Tin Plate Works, and in other ways extensively interested in the Welsh tin plate trade.

THE Baltimore Iron, Steel & Tin Plate Company's reconstructed tin plate plant at Locust Point, Baltimore, consisting of four black plate mills and four tinning sets, is in full operation. The company are turning out a high grade of charcoal, coke and terne plates, one brand of each description, namely, "Oriole," charcoal bright; "Locust," coke bright, and "Violet," terne.

A NEAT little folder in "dark green and gold, issued by the Aliquippa Tin Plate Company, Pittsburgh, Pa., advertises the brands of bright coke and terne plates manufactured by the firm. Special attention is called to their "Re-roll New Style" brand of high grade roofing plate, produced by a new process, for which a patent has been applied for. By this process it is claimed that an absolutely equal weight of coating is imparted to the entire surface of the plate. The Aliquippa Tin Plate Company's works, located at Aliquippa, Pa., consisting of one black plate mill and two tinning sets, give an average daily output of 60 boxes. The company's office address is 422 Telephone Building, Pittsburgh.

ACTIVE PROGRESS is being made in the building and equipment of the plant of the Star Tin Plate Company, at the foot of Twelfth street, Pittsburgh, Pa. It is expected that the works will be ready for operation in the latter part of August. The plant will include eight hot and nine cold mills, with a sufficient number of tinning sets to take care of the output of black plates.

THE tin-house department of the Old Dominion Iron & Nail Works Company, Richmond, Va., is in regular and active operation. So far, terne plates alone have been made, including eight separate brands. Two brands each of charcoal and coke finish bright plates will shortly be added to the company's products. The erection of four black plate mills, in the near future, is contemplated.

CHARLES C. CLUFF, 46 Wall street, New York, has been appointed Eastern agent for the Illinois Steel Company, and will sell, among other products of the concern, sheet iron, tin plate, bars, &c.

McCLURE & Co., 62 Second avenue, Pittsburgh, Pa., are distributing a folder, printed in red and blue, containing a list of the American bright and roofing plates specially manufactured for the firm, also the various grades of solder manufactured by them. An accompanying circular, addressed to architects and builders, calls attention to the merits of McClure's Redipped

roofing plate, which, it is claimed, is made from the best Siemens-Martin steel, heavily coated by the pure palm oil process, every sheet being stamped and re-squared.

THE tin plate works of the Laughlin Nail Company, now completing at Martin's Ferry, Ohio, are nearly ready for operation. It is expected that work will be begun about July 15. The plant consists of four hot and five cold mills and eight tinning sets.

The Aero Water Still.

The illustration herewith shows the Aero water still, manufactured by the Aero Water Still Company, 46 Wareham street, Boston, Mass., and designed to furnish a supply of pure water for family purposes where the local water supply is not of the desired purity. It is designed, for use, in connection with the ordinary cooking stove. Lime and other mineral and organic impurities of the water are retained in the still, and only pure water is given off. In passing from the still to the receptacle for catching the distilled water, the water drops through the air and thus becomes aerated. The

The Aero Water Still.

still is made in three different sizes for domestic use; and large styles are furnished for hotels, restaurants and public buildings. In use, the base should be filled with water until it overflows from the pipe D. Then fill the still with water by pouring it in at A, with the faucet B open, until the water begins to drop at D; then close faucet B and fill up to within ¼ inch of the top. After boiling for a time, the water in the top part gets hot; after which the faucet B should be opened so as to allow the water to drop slowly and keep a slight drip from D. This insures that the water level in the boiler is constantly maintained. The faucet C is to draw off pure water from the base, and is always ready for furnishing hot water for tea, coffee or other cooking purposes. Water for drinking purposes should be drawn from this faucet, and placed where it will cool. Should the pure water accumulate too freely in the fountain it will run over into the boiler below. When steam escapes from the top the top section should be replenished with cold water.

THE RETAIL STORE.

Why Wire is Put Up in Bundles of 63 Pounds.

One of the obscure questions connected with Wire is as to the reason for its being put up in 63-pound bundles. There is, we believe, no satisfactory answer, the origin of the practice being involved in obscurity. The following advices in regard to the matter, for which we are indebted to S. Barnett, Worcester, Mass., who is exceptionally well informed concerning all matters connected with Wire, will be of interest.

Putting up Wire in bundles of 63 pounds is a custom adopted by Wire manufacturers from the English Wire trade as a standard customary weight for a bundle of Market Wire or Wire which is sold to the Hardware trade for retailing.

An odd number of pounds like this for the weight of a bundle of Wire, which is not an aliquot part of a stone or hundredweight or of 100 pounds or a ton, would have been abandoned before this only it has been a happy average weight to make up a bundle of Wire of several pieces, in the same lengths as they come from the Wire block, and a convenient weight to handle for both seller and buyer, but there is no good reason to-day why any Wire should be put up in 63-pound bundles. Fifty or 100 pounds would be a more useful standard. Manufacturers prefer, when practicable, to sell in catch weight bundles, which occasions no waste in cutting one length of Wire to make exact weight. There are, however, several advantages in having exactly the same weight for each bundle, especially for carload lots, as in case of loss of Wire in transit, or of dispute in regard to weights between buyer and seller, if the number of bundles is known the weight can be estimated, and if the weight is known the number of bundles can be estimated. On catch weight bundles of Wire, weighed up in small lots for a carload and billed on the aggregate weight, and the Wire weighed in the same way when received by the buyer, it seldom happens that two weighers will get the same total weight. It is also an advantage to the manufacturer who works the Wire up into goods to give each of his workmen a bundle of the same weight each time, and simplifies the accounts he may keep of the amount of Wire used.

The question of the origin of this custom on Market Wire has been brought up frequently among wire workers, but never satisfactorily answered.

By referring to the Standard Dictionary under "Weight" in the table of current weights in use throughout the world and historic weights, you will notice that the British bushel of the value of $\frac{1}{4}$ hundredweight is represented by 63 pounds as the weight of a bushel of wheat, and I conjecture that whoever introduced the custom of using this weight for a bundle of Market Wire used this bushel weight as a basis. It was the custom in the United States 40 years ago to put up Market Wire in 63-pound bundles, and it was also imported from England in the same way.

From inquiries made here I understand that the large Wire mills in Eng-

land over 20 years ago were accustomed to put up Market Wire in bundles of 63 pounds. Fence Wire in 112-pound bundles (1 hundredweight), and fine sizes of Wire in stones of 12 pounds. A stone ranged all the way from 12 to 16 pounds, and I am told that a stone of Wire is 12 pounds in England the same as in the United States.

In Yorkshire, England, for many years it was the custom for the small Wire drawer to buy his Card Wire from the large manufacturer at No. 19 size, annealed, in 63-pound bundles, and draw it down to the finer sizes, and resell in bundles of 1 stone each.

J. P. Bedson, in his paper on "Iron and Steel Wire," read at the August, 1893, meeting of the Iron and Steel Institute in England, said in regard to Market Wire, that at Warrington, in 1840, the system of having the Wire drawer make up his Wire ready for the customer was abandoned, "and the work of Wire drawing was subdivided between annealers, cleaners, drawers and warehousemen. So much was this appreciated that the Wire was not only well received, but as a 'market Wire' secured a better price in those days."

Other varieties of Iron and Steel Wire are also put up according to customs established by different users. Netting Wire has been sold to the trade for so many years in bundles of 1 stone each that it is now generally known as Stone Wire, although the Netting manufacturers prefer it in catch weight bundles of 15 to 18 pounds each, and not to have a skein of this fine size of Wire broken to make exact weight.

Card Wire is put up in bundles of 60 pounds each, called a "Bow," but the card maker uses a coil of only 4 or 5 pounds at a time.

Music Wire is preferred by the piano string maker in 1-pound coils, as the workman cannot use a larger coil without getting it tangled, this Wire being very springy, but the trade who supply the string makers can use 5-pound coils conveniently.

Coppered or Furniture Spring Wire is most frequently put up in 100-pound bundles, but also in smaller bundles, and catch weights.

Telegraph Wire is ordered by the telegraph companies by the mile, as 100 miles or 1000 miles, but it is put up for shipment in catch weight bundles varying from 50 to 130 pounds. For instance: 1 mile of No. 8 Birming-

Fine sizes of Wire are very often put up in bundles of 1 stone each, also in catch weights. Fence Wire is put up in bundles of 100 pounds each, for convenience of handling, shipping and estimating on carload lots.

Pure Aluminum Egg Cookers.

Among the aluminum utensils put on the market by Silver & Co., 804-810 Hewes street, Brooklyn, and 20 Warren

Fig. 1.—Aluminum Egg Boiler.

street, New York, are the egg boiler and the egg fryer shown in the accompanying cuts. The egg boiler, Fig. 1, is 11 inches high, $4\frac{1}{2}$ inches in diameter at the line where the top of the boiler lifts off, and is provided with wrought iron standard in dead black

Fig. 2.—Holder for Egg Boiler.

finish. The egg holder, Fig. 2, has a capacity of four eggs and is lifted from the boiling water by the aid of the wire loops. The spirit lamp is reversible, one end holding the right quantity of

Fig. 3.—Aluminum Egg Fryer.

ham gauge Wire would weigh 378 pounds. This would be shipped in three bundles of about 130 pounds each. One mile of No. 14 would weigh 95 pounds, for which one bundle would be shipped weighing within a few pounds of this weight. Copper Trolley Wire is shipped in mile lengths on large reels made specially for this use.

alcohol for boiling eggs soft and the other end holding more for boiling eggs hard, so that timing the eggs is unnecessary. The aluminum egg fryer, Fig. 3, is made in a three egg size, but we are advised that a one and three egg size will shortly be made of cheaper material as well as in aluminum.

Some Stove and Hardware Dealers in Steuben County, N. Y.

BY HENDRICK.

Beautifully situated in the midst of the rich and thriving farming section of the county named lies the city of Hornellsville. It is here that W. G. Rose & Co. carry on the stove and hardware business, the house being one of the oldest established in the city. The firm carry a full stock of heavy and shelf hardware, agricultural implements, &c., and are the agents for the Andes stoves and ranges, made by the Phillips & Clark Stove Company. The firm also do a good deal in the way of hot air heating work, making use in nearly all of their contracts of the Kelsey furnaces, made by the Kelsey Furnace Company. The tin shop of the concern is located just above the main store, and in it they employ a large force of men manufacturing tin and sheet iron ware, as well as executing more or less jobbing work. At this season of the year the firm are pushing the sale of the New Process gasoline stoves of the Standard Lighting Company, refrigerators and other summer goods.

Sheldon Brothers occupy a large building on the main street, and do a thriving business in general hardware, stoves and farm machinery. The firm have been in business for many years and enjoy a large trade among their many friends. They place their orders for their line of parlor heaters as early as May 15, selling the Splendid ranges and heaters, made by the Fuller & Warren Company, in whose goods they have built up a large trade. Their store occupies two floors, the first being given up to hardware, paints and oils and house furnishing goods, while the second floor is devoted to a fine display of stoves and ranges.

At No. 3 Seneca street, just around the corner from the City Square, is located the new store of Schwaringle & Davis, who, though recently started, have built up a fine trade in hardware and house furnishing goods. They have pushed the sale of the Gold Coin ranges, made by the Bussey & McLeod Stove Company, and the Dockash goods, made by the Scranton Stove Works. Their tin shop is at the rear of the main store, where they do plumbing, tinning and general jobbing, Mr. Schwaringle having charge of this department. Just at present the firm are enjoying an excellent trade in bicycles, the front of their store to the left being given up to a display of the several makers' specialties for which they are agents.

M. J. Shaw is agent in Hornellsville for the Howe Ventilator parlor heater made by the Cortland-Howe Ventilator Stove Company. He sells for his leading line of ranges the Beaver, made by the Danville Stove & Mfg. Company, and the Amherst, made by the Buffalo Co-operative Stove Company. He also carries a line of shelf hardware, tinware and house furnishing goods, and gives attention to roofing and tinning in all its branches, employing several men in that department.

Charles F. McGuire, although not engaged in the sale of stoves and ranges, carries a heavy stock of general hardware and house furnishing goods. He also does plumbing work and light repairing, his trade being principally among the people in the city.

Somewhat away from the main street, and yet prominently located on the line of the street railway, is the large store of Wallace Roberts, where can be found a full and complete assortment of Red Cross stoves and ranges, made by the Rochester Co-operative Foundry Company. Since

the time Mr. Roberts has taken hold of this line he has sold many hundreds of the stoves, supplying his friends in the city as well as in the country. He is also agent for the Perfect furnace, made by the Richardson & Boynton Company, and has executed many large contracts during the past season, heating some of the finest residences of the city. In his particular line of work Mr. Roberts has achieved a reputation for doing a good job. He also carries a stock of hardware and house furnishing goods, but devotes most of his time to the stove and heating business.

Five miles east of Hornellsville, and connected by an electric railroad, is the village of Canisteo, where, since 1868, O. O. Laine has successfully conducted the hardware and tin business. At the present time he occupies a large double store, opposite the village green, where he carries a stock of general hardware and house furnishing goods. For his specialties in the stove line he handles almost exclusively the Sterling goods, made by the Sill Stove Works. He has sold many hundreds of these stoves to the farmers in that section of the country, a peculiar feature of the trade being that very few, if any, small stoves are sold in that neighborhood, Mr. Laine seldom having a call for a parlor heater smaller than 14-inch fire pot. He also carries on the tin and jobbing business, doing considerable if the way of tin roofing and furnace work.

Burrell & Carroll are also at this place. Having recently started in business, all their stock is new, and the store presents a very attractive appearance. At the right, as one enters the store, is a long row of hardwood boxes containing shelf hardware, with samples exposed, while at the left hand is a display of house furnishing goods and tinware. The leading lines of stoves are the Acorn goods, made by Rathbone, Sard & Co., and the Dockash, made by the Scranton Stove Works. Mr. Burrell is something of a fisherman, and loves to tell of his recent experiences during a trip through the South. He has displayed in his windows several large fish that he secured while on his vacation.

At Addison, N. Y., are Moore & Weatherby, who are engaged in the stove and hardware business which was established by Brewster & Brother in 1840. The present firm enjoy an excellent trade in the several lines of goods they handle, the leading specialty in the way of parlor heater being the Splendid, made by the Fuller & Warren Company. They are also agents for the sale of the Amherst range, made by the Buffalo Co-operative Stove Company. The firm deal in house furnishing goods, shelf hardware and farm machinery, the trade being almost exclusively with the farmers in that section of Steuben County, of which the boast is made that it furnished the hay and buckwheat that received first prize at the Chicago Fair in 1893.

A. Roberts recently succeeded K. E. Whitmore in the hardware business in Addison, and has added considerably to what was an extensive assortment of house furnishing goods and hardware. He employs several men in the manufacture of tinware, and does more or less jobbing and tin roofing. His principal lines of stoves are those made by the Sill Stove Works. He is also agent for the Splendid oil heaters and cook stoves, made by the Novelty Mfg. Company of Jackson, Mich.

L. G. Laine carries on the tin roofing and jobbing business nearly opposite the American House. He is agent in Addison for the Red Cross stoves and ranges, made by the Rochester Co-operative Foundry Company.

W. F. Bronson does a good business in stoves and hardware at Painted Post, N. Y. He also sells stoves, ranges and furnaces, and does tinning in all its branches. His store being the only one of the kind in the village, gives him an excellent trade among the inhabitants of the place and the farmers in that vicinity.

No. 343 Oil Heater.

The accompanying illustration shows one of a new popular price line of oil heaters manufactured by Edward Miller & Co., Meriden, Conn. No. 343, shown herewith, is one of the most attractive designs and embodies all the latest improvements. The base and legs are one piece of cast iron japanned, and the front or oil receptacle is of brass nickel plated. The burner is specially made for heating purposes and was constructed so as to give the largest possible amount of heat. It burns without a chimney and the

No. 343 Oil Heater.

flame may be adjusted at will. A striking feature of this heater is a cast plate which spreads the flame and directs it to the sheet iron drum which radiates it still further. This drum is of graceful shape, is surmounted by a handsome nickel ornament and is attached to the base by a hinge at the back and rests on two neat legs at the front, and by means of the hinge it may be thrown back whenever the fount is to be removed. As will be noticed this arrangement leaves the fount entirely open, giving a free current of air, which keeps the oil receptacle cool and promotes perfect combustion. This line of heaters is offered by the manufacturers as excelling in simplicity, ease in handling, cleanliness and heating power. The illustration is one of twenty-five different styles which are shown in the company's catalogue No. 48.

The Niagara Falls Power Company have not yet begun to lay their transmission wires to Buffalo. Some difficulties have arisen between the City Council of Buffalo and the company over a section in the proposed power franchise which stipulates that the power company shall fix a price for its power delivered at the Buffalo city line. This clause is objected to by the company, who refuse to accept a franchise fixing any price for power or light. It is believed that a clause will be substituted securing to the city a percentage of the gross receipts of the company.

Improved Meriden Lamp.

Meriden Bronze Company, 30 Park place, New York, are marketing the Improved Meriden lamp, as here shown in sectional form, designed for the ensuing season's trade. The tubular wick carrier with toothed fingers is raised and lowered

Fig. 1.—Chimney Gallery Raised.

by means of the parallel lifting device, joined above by a knob which serves as a finger piece. It will be seen the entire wick raising apparatus consists of but two pieces, readily detached when the burner is removed from the fount, but impossible under other conditions.

In re-wicking the tubular wick needs but to be slipped over the wick tube, when it is gripped by the prongs and drawn downward by pressing on the knob.

The upper part of the burner has a chimney gallery with bayonet joint to sustain the chimney while being lighted. The central cone, not seen in the engraving, is doubly concave, with perforations in the concave surfaces, insur-

Fig. 2.—Sectional View of Oil Pot and Wick Lift.

ing an adequate supply of air, preventing, it is said, any tendency to weep.

The burner is screwed into the fount or oil pot, making it secure and free from danger in lifting.

THE PAXTON HARDWARE MFG. COMPANY, Paxton, Ill., formerly known as the Leach Roaster & Baker Company, have opened a branch office in Room 11, Montauk Block, 115 Monroe street, Chicago. Messrs. Murray & Lyman have charge of

this department, and will make a specialty of visiting the jobbing trade. They have recently obtained control of the Champion Roaster and many other Hardware Specialties. These goods have been sold during the past seven years through agents and are well known by consumers throughout the country. They now anticipate reaching the consumer through the hands of jobbers and retailers, and for this purpose are increasing the capacity and output of their plant at Paxton by erecting new buildings and putting in new machinery.

Bryant's Lightning Mixer and Egg Beater.

The J. H. Bryant Mfg. Company, 61 to 67 Michigan street, Chicago, have brought out a new pattern of their mixing machine and egg beater, which is intended expressly for family use. An illustration is herewith given. It is intended for mixing angel food or other cake, pan-

Bryant's Lightning Mixer and Egg Beater.

cake batter, pie crust, beating eggs, whipping cream, &c. The machine has four distinct feeds and three dasher motions, enabling it to do the work quickly and thoroughly. The mixing pan is porcelain lined and the dashers are tinned. The capacity is 8 quarts. The machine is handsomely painted and decorated.

Rochester Giant Lamp.

The Rochester Lamp Company, 42 Park place, New York, have perfected and are now offering to the trade the Rochester Giant lamp in an improved form, as hereshown. One of its features is the arrangement of the air supply and vents. Intended largely for outdoor use, precautions have been taken to so regulate and control the air supply as to make it free from the influence of high winds or any swinging motion. In each corner is an interior tapering tube, perforated at the top outside and open at the bottom inside. This provides a series of channels for properly distributing currents of air on accepted tubular principles. At the bottom on all sides the metal is perforated freely to admit copious supplies of new air, the force of which, however, before reaching the powerful flame is broken by first striking the solid interior wind guards. As made now the fount is suspended in a wide circular metal band, which fits under the projecting rim of the oil pot and is sustained by four wire rods riveted to the corners of the frame. The bottom of the frame is glass, while the sloping roof or dome is

lined with corrugated metal reflectors which prevent any under shadows. The vent at the top consists of two perforated metal cylinders or cones, causing a check on the upward current. Underneath the cap is an asbestos lining to prevent overheating the metal and in-

Rochester Giant Lamp.

luring the paint. There are no soldered joints, it is said, every connection being riveted.

THE firm of Sheehan & Linton of New Britain, Conn., stove dealers, have been dissolved. Mr. Linton will continue the business.

REYMOND & GOTTLÖB, 830 Broadway and 18 Maiden Lane, New York, manufacturers of and dealers in aluminum goods, cooking utensils and household ware, distribute as an advertisement an attractive little paper cutter and 5-inch rule of aluminum. The firm report a large and increasing demand for their specialties in the new metal. They are constantly adding to their lines of aluminum household and fancy goods. The firm issue a large 10-page illustrated catalogue of the various articles manufactured and dealt in by them. These include cooking utensils and household ware, napkin rings, sugar, salt and pepper shakers, egg cups, match holders and various fancy articles. They call special attention to their camp cooking outfit for six persons, every article in which is manufactured of aluminum, each piece being spun from a single piece of metal without seams. A complete outfit embraces 40 different articles, the total weight being only 13½ pounds. A lesser field outfit of 21 articles weighs but 6 pounds.

The Adams Coffee Pot.

Good coffee is so indispensable at the dining table that the apparatus for producing it is always interesting. A new pot for the public favor is being made by Adams & Son, Owego, N. Y., who have taken out patents for its construction. A sectional view is shown herewith. The body, or outside, is an ordinary straight pot. Within this is a loose fitting cylinder, with closed top, and with a knob or handle to lift by. Within the lower end of this cylinder is a cone shaped

The Adams Coffee Pot.

basket, made of tinned wire cloth, and held in position by a tinned spring-wire frame, which is easily removed to place the grounds within it. A small opening in the top of the cylinder allows the air to escape, so that, when the cylinder (with the basket of grounds) is placed within the pot, which has the required amount of water, it will settle to the bottom, thereby immersing the grounds in the water. When a sufficient pressure of steam is produced, during the steeping process, it will raise the cylinder and thereby remove the grounds out of and above the liquid, thus putting a stop to the steeping. In operation, after the pot and basket have been filled, the Adams pot is said to take care of itself and work automatically without attention. If a stronger coffee is desired than is gained from one steeping the pot should be moved to a cooler part of the stove, when the basket will settle and enable the ground coffee to go through the process a second time. With this pot, it is claimed, a clear coffee of an equal strength and flavor can be made every time by an inexperienced person and bitter coffee is impossible. The pot can be easily cleaned and is not likely to get out of order.

Exhibition of Appliances.

Several interesting devices are on exhibition at the Bohemia Roof Garden, at Thirty-sixth street and Broadway, New York, which is open afternoon and evening. In the evening the building is lighted by Wellsbach burners, using gas manufactured in the room by a machine made by the New York Gas Atomizer Company of 1362 Broadway, New York. The plant is similar to those placed by the company wherever artificial gas for lighting is desired and where no corporation gas works are convenient. The gas is manufactured from gasoline, which may be stored a short and safe distance from the building and carried to the atomizer by pipes. The machine, which is operated by a weight, runs the apparatus, and compresses the gas under a sufficient pressure to force it through the pipes to the burners, where it is used for illumination. In connection with their exhibit they show a varied line of gas cooking and heating appliances suitable for use

in connection with the gas made in their apparatus. One of these exhibits is a hot air furnace designed to use illuminating gas. Another exhibit is made by the Oilgas Heating Company of 312 Main street, Peoria, Ill. Their exhibit shows the use of oil for a fuel in an ordinary cooking range. At one side of the range on the floor is a 10-gallon galvanized iron tank containing about two gallons of oil. Connected with the tank is an air pump and a pressure gauge for use in subjecting the oil to a pressure of five pounds, which forces it through the piping to two burners placed under the cooking holes in the fire chamber of the range. In operation a small quantity of oil is run into the drip cups below the burner, when the supply is shut off and the oil lighted. After the burner is hot the supply is turned on again and the oil generated into a gas previous to its exit, through a small opening, to an air mixing chamber. From the air mixing chamber it is distributed to a burner orifice and burns with a pink tipped blue flame of intense heat. This apparatus, it is said, is used largely in the West, and is being introduced in the East, little objection being made to it by the insurance companies, owing to the fact that the reservoir containing the oil is located below the fire chamber and will not rise to it without the application of pressure. The oil tank is provided with solder plugs, so that should a conflagration take place in the building in which it is used these plugs will melt and allow the gas to escape from the oil, thus preventing an explosion.

The Ezy Raisin Seeder.

The American Specialty Company, Hartford, Conn., and 182 Lake street, Chicago, are placing on the market the

The Ezy Raisin Seeder.

raisin seeder here shown. In operation, the meat of the raisin is crowded up into the grooved presser head and the seeds unbroken are forced through the wire bed into the removable tin cup. It is explained that the form of wire bed gives increased strength and that the wires being unbroken do not become bent or broken. The work is always in sight and a pound of raisins, it is stated, can be cleanly seeded in five minutes. The seeder, which is manufactured by the company, was patented May 21, 1895, and is designed to retail for 25 cents.

MEMORANDA.

THE Canfield Stove Company of Kingston, N. Y., celebrated the completion of their building a few days ago by hoisting over it the Stars and Stripes on a large gold mounted staff. The new structure is four stories in height and contains about 10,000 square feet of floor space. The first and second stories of the front are in the form of an arch made of Trenton brick, with keystone and trimmings of blue cut stone. Above this are two stories constructed with selected local brick with arches and pilasters, the whole being surmounted with a glazened cornice. At each side of the entrance are large show windows. The floor of the vestibule is laid with tile of handsome design and has the company's name in white tile in the center. The design of the entire front of the structure is different from anything erected in that locality and has attracted much attention. The cellar of the building is fitted with several hundred bins and racks for holding repairs and also contains the steam boiler. The first floor, devoted to the sales department, has a handsome steel ceiling neatly decorated, hard wood floor and tinted walls. One large show window is fitted up as a modern bathroom, with handsome porcelain bathtub, modern embossed water closet, and pink lavatory marble floor and tile wainscoting, while the other window has a display of mantels with open fire place grates and tile hearths, ranges, &c. The office is located in one corner of the room on a raised platform and inclosed with a neat iron railing. It is connected with the other floors by means of speaking tubes and call bells. The second floor is devoted wholly to plumbing, heating, tin and sheet iron workrooms. In one corner is a private office where estimating and drafting are executed. The third floor is devoted to stoves, and the fourth to the storage of tinware and lighter goods. The elevator is so placed that goods can be shipped or received and distributed to the different floors without interfering in any way with the sales department. Nearby is a dumb waiter, used to handle small articles between the workshops and the first floor.

BISSELL CARPET SWEEPER COMPANY, Grand Rapids, Mich., advise us that during next month they will make a number of valuable additions to their well-known line of Carpet Sweepers. For the coming fall season they state that their line of these goods will be especially complete and sufficient to meet every demand in every section of the world for Carpet Sweepers.

Some interesting figures in regard to the city of London are gleaned from a recent report of the Registrar General of that city. The estimated population of London last year was 4,349,166. The area included in the city was 121 square miles, containing no less than 1793 miles of streets. On the average 58 persons inhabit each acre of ground in the metropolitan district, or 87,250 on each square mile. The births registered in London last year were 180,553, equal to 30.1 per 1000 of the estimated population. The excess of births over deaths was 53,514, the deaths numbering 77,039, or in the proportion of 17.8 per 1000 persons living.

The International Railway Congress was formally opened in London, on Wednesday, by the Prince of Wales. For five weeks there will be a series of meetings and excursions to various points of interest in Great Britain. Fifteen American railroad companies are represented at the Congress.

PLUMBING and GAS FITTING.

The Effects of Blasting on Plumbing.

The Fire Commissioners of the city of New York have applied to have some stringent regulations enforced in reference to the way blasting is done in the city. Their intentions seem to be in the direction of public safety rather than to secure immunity from fire. Their recommendations provide for a maximum size of blasting charge and for the covering of the ground around the blast with timbers of sufficient size and weight to prevent the material being hurled into the air as a result of the charge. No serious complaint has been raised as to the effect of the large charges used in the blasting and the resulting shocks on the plumbing work in buildings in the near vicinity, though it is quite possible that some of the split hubs and cracked soil pipes and fittings are due to this cause. It is also reasonable to think that some of the horns on earthenware were broken as a result of the shaking of the buildings resulting from blasting of cellars in the neighborhood. It has been the experience of all plumbers that the sanitary system of a building is more or less strained and deranged as a result of the natural settling of the building; and if this is true, how much more likely are the shocks mentioned to produce leaks that would permit sewer gas to freely enter a dwelling?

Montreal Plumbing News

We are indebted to J. W. Hughes, 26 Bayle street, Montreal, Canada, for the following letter relating to plumbing matters in his neighborhood:

The return of John Date, who represented the master plumbers of the Province of Quebec at the annual convention of the National Association of Master Plumbers, has infused fresh energy and enthusiasm into the members of the craft in this city. Mr. Date reported his reception as being hearty and cordial beyond his greatest expectations. Active steps will at once be taken toward completing the formation of a Dominion Master Plumbers' Association in order to facilitate the union of the members of the craft with the American plumbers. A petition has been sent to the Mayor of Montreal, praying for the repeal of such portions of the new plumbing by-laws as forbid the use of tile drains inside of dwellings. The Master Plumbers' Association, however, are taking active steps to prevent so disastrous and backward a move as this would prove to be, should the petitioners succeed in their mistaken efforts. The petitioners claim suitability, durability and cheapness for the tile pipe as compared with cast iron. It is surprising that in the present day such claims should be advanced for a material that has proved in thousands of cases most unreliable, and which is forbidden for use as inside drains by all really well regulated com-

munities. The matter has been left in the hands of a special committee under the chairmanship of Alderman C. Beausoleine, who, as chairman of the City Health Committee, may be depended upon to see that no such interference with the most important clause in his plumbing by-law is permitted.

National Association of Master Plumbers.

We print below a revised and corrected list of the officers and committees of the National Association of Master Plumbers, including the full list of State vice-presidents, with their addresses:

Officers.

President. James Meathe, 92 Fort street, West, Detroit, Mich. (Builders and Traders' Exchange).
Vice-President. Thos. H. Radcliffe, 234 Fulton street, Brooklyn, N. Y.
Financial and Recording Secretary. James H. Crumley, 284 Woodward avenue, Detroit, Mich.
Treasurer. Wm. E. Goodman, 444 East Water street, Milwaukee, Wis.

EXECUTIVE COMMITTEE.

James Meathe, 92 Fort street, West, Detroit, Mich.
Thos. H. Radcliffe, 846 Fulton street, Brooklyn, N. Y.
James H. Crumley, 284 Woodward avenue, Detroit, Mich.
Wm. E. Goodman, 444 East Water street, Milwaukee, Wis.
John Mitchell, 113 Hudson street, New York City, N. Y.
Daniel G. Flunerty, 478 Boylston street, Boston, Mass.
L. B. Cross, 1212 Main street, Kansas City, Mo.
C. C. Dewstoe, 290 Seneca street, Cleveland, Ohio.
Wm. H. Doyle, 221 South Sixteenth street, Philadelphia, Pa.
T. P. Culleton, 50 North Clark street, Chicago, Ill.

APPRENTICESHIP COMMITTEE.

J. L. McShane, 19 Seventh avenue, Pittsburgh, Pa.
Chas. H. Humbert, 401 Market street, Pittsburgh, Pa.
F. P. Blythe, 56 Wylie street, Pittsburgh, Pa.

ESSAY COMMITTEE.

Paul Redieske, 99 Claybourn avenue, Chicago, Ill.
J. J. Wade, 298 Dearborn street, Chicago, Ill.
Jno. G. Roland, 952 North Halsted street, Chicago, Ill.
Thos. Conway, 614 Sixty-third street, Englewood (Chicago), Ill.
W. T. Geary, 72 Thirty-first street, Chicago, Ill.

SANITARY COMMITTEE.

Jas. Ahern, 280 Asylum street, Hartford, Conn.
L. H. Mills, 28 Middle street, Bridgeport, Conn.
J. B. Wielant, 67 Arch street, New Britain, Conn.
S. E. Dibble, 639 Grand avenue, New Haven, Conn.

Thos. D. Barlow, 63 Grand street, Waterbury, Conn.

STATE VICE PRESIDENTS.

Arkansas, J. A. Monagan, ———
Eureka Springs.
Arizona, D. H. Burtis, 27 East Washington boulevard, Phoenix.
Alabama, Jas. T. Palmes, 69 St. Francis street, Mobile.
California (Southern), Geo. E. Howe, 554 South Spring street, Los Angeles.
California (Northern), Jas. E. Britt, 7 Eighth street, San Francisco.
Colorado, Jos. A. I. Claudon, Glenwood Springs.
Connecticut, Andrew J. Clerkin, 779 Grand avenue, New Haven.
Delaware, I. N. Eaton, 407 Shipley street, Wilmington.
District of Columbia, Jas. Cunningham, 930 S. street, Washington.
Florida, Wm. Clark, 47 Forsyth street, Jacksonville.
Georgia, W. P. Bennett, 563 Mulberry street, Macon.
Illinois, Jos. B. Breen, 368 West Van Buren street, Chicago.
Indiana, Chas. Wahnsiedler, 213 Upper Second street, Evansville.
Iowa, John Burnside, 611 West Locust street, Des Moines.
Kansas, C. J. Prescott, 113 East Seventh street, Topeka.
Kentucky, A. M. Ramsey, 806 W. Market street, Louisville.
Louisiana, M. T. Rosenblath, 231 Travis street, Shreveport.
Maine, Jno. B. Smith, 40 Main street, Lewiston.
Maryland, J. C. Mitchell, 103 West Lombard street, Baltimore.
Massachusetts, Jno. F. Deedy, Salem square, Worcester.
Michigan, Wm. T. McGurrin, 184 East Filton street, Grand Rapids.
Minnesota, Geo. A. Kees, 473 Broadway, St. Paul.
Missouri, R. T. Connell, 815 Francis street, St. Joseph.
Mississippi, T. J. Cady, Columbus.
Montana, I. Krueger, 118 North Main street, Butte.
Nebraska, John Rowe, 1517 Howard street, Omaha.
New Hampshire, Robert J. Donnelly, Portsmouth.
New Jersey, C. Sullivan, 184 Market street, Newark.
New Mexico, A. H. Staehlin, Albuquerque.
New York, W. G. Reid, 111 East Avenue, Rochester.
Ohio, Louis Popowsky, 146 Woodland avenue, Cleveland.
Oregon, L. H. Buddemer, 285 Yamhill street, Portland.
Pennsylvania, John A. Kramer, 912 North Third street, Harrisburg.
Rhode Island, Patrick Tierney, 522 Westminster street, Providence.
South Carolina, O. S. Miskally, 194 King Street, Charleston.
Tennessee, G. P. Ashe, 701 Gay street, Knoxville.
Texas, W. W. Otter, Houston.
Utah, Henry C. James, 164 West Temple street, Salt Lake City.
Vermont, J. P. Bagley, White River Junction.
Washington, J. E. Young, 1003 A street, Tacoma.
Wisconsin, W. H. Haley, 445 Jefferson street, Milwaukee.
North Carolina, W. H. Byce, Asheville.

Reception to President Meathe.

The Master Plumbers' Association of Detroit, feeling that it was an honor to have one of their number elected to the presidency of the National Association of Master Plumbers, and as an expression of their feeling, tendered an informal reception to James Meathe, on last Monday evening, at the rooms of the Builders & Traders' Exchange, Detroit, Mich.

The reception was attended by nearly all the members of the Detroit association and a large number of guests, among whom might be mentioned: A. G. Alexander of the famous "Ben Hur" Farm, Walkerville, Ont.; E. A. Morris, secretary of the Detroit Lead Pipe & Sheet Lead Works; James Harvey and S. Clark of Harvey Sons Mfg. Company, Inc. Walker and C. C. Deuell of James Walker & Sons, Chas. B. Sales and Murray W. Sales of Sales Bros., Jos. Boyle, secretary of the Park & McKay Company; Sanitary Clerk Wisner of the Health Department. The Board of Directors of the Builders & Traders' Exchange were also present and extended their congratulations. Several other prominent members were present, including John Finn, Martin Scholl, Jr., R. Nelson, Conrad Clippert, Jos. Myles, J. D. Candler, Frank W. Oliver, Robert Robertson, M. Finn, Peter Brennan, Benj. F. Guiney, secretary of the Michigan State Association of Master Plumbers; W. Etnamet Crosby, national executive clerk N. A. M. P. The rooms were tastefully decorated for the occasion. Spell's orchestra furnished the music. Coon & Walker, caterers, and a committee in charge furnished a liberal supply of refreshments and cigars. Mr. Meathe was introduced by James W. Portland, who spoke for the Detroit association, saying how much they appreciated the honor which had been conferred upon Mr. Meathe, as much for themselves as for that gentleman; that, knowing Mr. Meathe as well as he did, he had perfect confidence in the fact that the National Association would have no cause to regret their action. Mr. Meathe thanked those present for the courtesy. He spoke of the National Association and its splendid growth and its objects, and at the conclusion of his remarks promised that the good work which had already been done by the association would continue during his administration, and asked the co-operation of all, that he might succeed. During the evening, in addition to the orchestra, an informal entertainment was provided by the Eureka Quartet, one of the leading musical organizations of the city. The affair lasted until some hours after midnight. Everything was informal and everybody had a good time.

The New Jersey State Association of Master Plumbers

Last night, in response to a call from Elias Berla, president of the New Jersey State Association of Master Plumbers, the plumbing trade from all sections of the State was represented at a meeting at the headquarters of the Newark association, at Newark, N. J. The object of the meeting was to ratify the formation of a State association of master plumbers for New Jersey, which was made by the delegates to the national convention at Philadelphia on June 13. The officers selected at that meeting were re-elected, and a series of plans formulated for thoroughly organizing the plumbers throughout the State. Among those in attendance and active in making the meeting a success were Elias Berla,

C. Sullivan, the new State vice-president; Alexander Don, Charles E. Bond, W. Zelfi, F. J. Sturm and N. J. Steimer of Newark; John Hickman, J. T. McNabb and J. Kearney of Paterson. After the business of the meeting was transacted a light collation was served and the delegates took their departure.

Detroit Plumbers Must Reregister.

Under the new rules governing the Bureau of Sanitary Plumbing, house drainage and ventilation—in accordance with the State law creating the Board of Health—all plumbers in Detroit must be registered at the Health Office before September 1. This includes all who have been examined and licensed as well as those who have not. Those who have certificates and licenses can obtain new licenses and certificates at the Health Office without cost and without undergoing new examinations. Those having the necessary documents who fail to reregister will have their licenses and certificates revoked and will be required to pass another examination before obtaining new papers. Heretofore the cost of licenses has been \$3 each, while \$1 has been charged for certificates. Hereafter the cost will be \$1 for a license and certificate issued to one person, and 50 cents where only the certificate is issued. Copies of the new rules governing sanitary plumbing, house drainage and ventilation may be obtained at the Health Office free of cost.

TRAPS AND VENTS.

THE E. C. CAUVET Company of Minneapolis, manufacturers of plumbers' supplies, have been incorporated, with a capital stock of \$10,000.

J. S. WILLIAMS, Beaver, Pa., has formed a partnership with Mr. Johnson, a plumber, and the firm will be known as J. S. Williams & Co.

THE master plumbers of Cohoes, N. Y., have organized and elected these officers: President, A. G. Burbanks; vice-president, W. J. Barrett; secretary, Bart. Cooney; treasurer, William English; trustees, Henry Lancaster, David Clark and H. E. Bottum.

C. F. JENKINS, Elmira, N. Y., succeeds the firm of Le Valley & Jenkins in the plumbing business at 154 Lake street.

JOHN VERMEULEN has withdrawn from the plumbing and heating firm of Gardinier & Vermeulen, Paterson, N. J., and will conduct a plumbing, steam, gas fitting and sheet metal working business at 20 N. Main street, Paterson, N. J.

WORK is reported brisk at the brass shops of the E. Stebbins Mfg. Company, Springfield, Mass., makers of plumbers' brass and iron goods, and owing to increased business wages have been advanced and the working force largely augmented.

FRED HAND has opened a plumbing shop at Framingham, Mass.

ALL the operatives in the sanitary ware potteries at Wheeling, W. Va., have been given an advance in wages of 10 to 40 per cent., in accordance with the recent action at the Trenton, N. J., potteries.

ALL the plumbing fittings of the new cup yacht "Defender," now under construction at the Herreshoff yards, Bristol, R. I., are to be made of aluminum. Everything about the kitchen, in the way of cooking utensils, &c., is

also constructed of this metal, in order to secure the minimum of weight on board.

JAMES MEATHE, president of the National Association of Master Plumbers, will make the national headquarters at Detroit, in an office in the Builders and Traders' Exchange, 92 Fort street, West, where all communications should be addressed.

THE Campbell Supply Company of New York City have been incorporated to purchase and sell plumbers' and steam fitters' supplies, with a capital of \$8000. The directors are William Campbell, M. F. Campbell and John Buzzini of New York.

D. B. ARMSTRONG & Co. have moved their plumbing business from Roxbury to 106 Perkins street, Somerville, Mass.

BRADLEY & KNOWLES, plumbers, at Arlington, Mass., sustained a \$600 loss by fire this week, partially covered by insurance.

J. O. WILSON is making 92 Walker street a bright spot in New York. This is the city office of R. M. Wilson, Rome, N. Y. The plate glass window has been polished, and there is displayed one of the Wilson patent solid copper bathtubs, handsomely nickel plated, resting on gold bronzed ornamental supports, and finished with a selected polished wood rim. It sheds a refugence that is dazzling. Plumbers who wish their customers to be "in the swim" should provide them with a Wilson plated solid copper bath.

THE Master Plumbers' Association of Newark, N. J., has appointed Ira Budd, F. J. Sturm and William Jacobi a committee to make arrangements for the annual outing and clam bake at Pleasure Bay, N. J., on Saturday, July 27. Already a very handsome souvenir programme has been prepared for distribution.

THE Victor Mfg. Company, Blairsville, Pa., are now running their works on a fine line of enameled baths, sinks, lavatories, hopper closets and enameled sanitary ware. They also make a specialty of enameled goods of every description, such as acid proof caldrons, preservers' kettles, porcelain lined filters and water coolers. It is claimed that their enamel is an insulator and can be used with advantage in electrical work. Their furnaces are heated with natural gas, giving a clean heat of very high temperature which enables them to turn out a fine quality of ware. Their porcelain enamel is said to be a very hard, vitreous substance, very white, possessing a high glaze, and adhering tenaciously to the iron.

THE Mosely Folding Bath Tub Company of Chicago report a steadily increasing demand for their specialties, particularly bath heaters and range boiler heaters. A letter from a party using one of their gasoline heaters for the kitchen boiler states that it is like the bicycle, and wonder is expressed that the user ever got along without it, and that a quart of gasoline will heat a 30-gallon boiler hot enough for laundry work at a cost of 3 cents. These heaters have been placed in the residences of some of the most prominent people in different sections of the United States.

THE Union Brass & Metal Mfg. Company, St. Paul, Minn., are issuing their 1895 catalogue of brass goods and plumbers' specialties, known as the Union Catalogue B. An introduction calls attention to the fact that they are adding to their line of specialties and that all their goods are inspected and tested previous to shipment. A line of Union siphon tanks of various styles is

illustrated. Another series of illustrations shows the Union closet seats and closet supplies. A page is devoted to showing the Success siphon valve, followed by ball cocks, legs for closet seats and Union closet repair connection. Two pages are devoted to list prices for a variety of plumbers' brass goods. The next two pages illustrate Pressure cleanouts and pipe closers for use in testing soil pipe. The last page shows an illustration of the Hercules seamless copper ball float for use in steam traps, receivers and hydraulic machinery where high pressure is used.

THE Horix Mfg. Company, 970 Hamilton street, Cleveland, Ohio, are issuing their 1895 catalogue of the Lightning water heater. The heater is made in two sizes, the larger size being designed for heating water instantaneously for bathing and laundry purposes; and it is claimed that it will furnish a continuous stream of water at any given temperature, regulated by means of the supply cock, up to 150 degrees, the smaller size being adapted to general domestic use. Testimonials accompany the catalogue.

H. P. TREAT, mechanical engineer and millwright, is sending to the trade a blotter from the Wallabout Market Jobbing Shop, 176 Flushing avenue, Brooklyn, calling attention to the varied character of work which one responsible party is prepared to do in a house, store or factory. Plumbing, gas fitting and steam and hot water heating is looked after in one of their departments. Hoisting machinery, steam and gas engines, electric motors and dynamos and general electric work occupies another department. The carpentry and millwright work is another department.

AMONG the contracts recently taken by J. J. Colvin, 159 La Salle street, Chicago, can be mentioned the following: Tin, galvanized iron, copper and tile work for the three residences of J. L. Cochran, Edgewater; galvanized iron work for the store and flat building of Charles Hoff, Laurel avenue; galvanized iron and slate work for the Presbyterian Church, Washtenaw avenue; galvanized iron work for the store and flat building of John Bell, West North avenue; copper and galvanized iron work for the store and flat building of M. L. Eckert, North Clark street.

THE following plumbing firms have lately started business in Chicago: Sporer & Hinzle, 429 School street; Frederick W. Heck, 3557 Wentworth avenue; John J. Foster, 800 Twelfth place; Gellret & Weil, 819 West North avenue; Burt & Stewart, 5622 Halsted street; Conway & Barrett, 1018 West Fifty-third street.

We are indebted to Albert Spies, editor of *Cassier's Magazine*, for an advance copy of the Niagara Power Number of that journal. The volume is notable on many accounts, giving a complete story of the Niagara power enterprise in ten articles with nearly 200 illustrations. The articles are written by eminent men connected with the work, and the illustrations are beautifully executed and printed. The style of presentation is in keeping with the excellent material presented.

An entirely new type of vessel will, it is reported, soon be built at Chatham for the British Navy. She will combine the features of a fast gunboat and a torpedo boat destroyer, will be propelled by electricity and possess a submergible hull. The vessel will be 210 feet in length and is designed to make a speed of 30 knots an hour.

HEATING NOTES.

WE are indebted to the Gurney Heater Mfg. Company, 163 Franklin street, Boston, Mass., for a copy of their trade catalogue for 1895. The volume, which is described as the desk edition of the catalogue, is about 8 inches square, fastened at the back with a yellow silk cord and bound in flexible covers of green paper, with the trade name of the boilers in gilt on the side. In an introductory note they call attention to their well-known line of hot water heaters, and further mention that in response to a desire expressed by architects, engineers and fitters who have been pleased with their hot water heaters, they have placed upon the market a series of steam boilers. They favor hot water for heating as a general rule, but recognizing the demand for the other style of apparatus they have brought them out to meet the wishes of the trade. Following the preface is the announcement in prominent type, "Our manufactures are sold only to the trade. We are not contractors for erecting apparatus." The first part of the pamphlet, covering 42 pages, relates to hot water heaters, the 300 Series, Bright Idea, Double Crown and Defiance being illustrated by numerous cuts. The brick set and portable heaters are shown and full descriptions are given of the construction and special features of the apparatus; special views of the parts are presented and tables of sizes and prices given. Part 2 relates to steam boilers, showing the Gurney, Bright Idea and Defiance. The apparatus are similarly illustrated with general and sectional views and full particulars are given of their sizes and capacities. The Gurney radiators occupy part 3, the Gurney, Harvard and Yale Quintet being noted. Part 4 is the fitter's guide, with illustrations, tables, data and other useful information. This covers, including the estimate blanks, over 40 pages and is a repository of much useful information for the steam fitter. House plans are presented, showing the run of pipes; a sectional view explains an overhead tank system of hot water heating for use in offices; several illustrations and information are given respecting steam heating and at the end are serviceable tables. A cipher guide and alphabetical index complete the pamphlet, which will be a welcome one to those engaged in the steam and hot-water heating business.

THE Elwood Radiator Works, Elwood, Ind., resumed operations last week. No radiators will be made for the present, but the plant will be remodeled and thoroughly equipped with new and modern machinery. Meanwhile, the present stock of radiators will be disposed of and arrangements made for the sale of all the future product of the plant. The works, it is reported, will employ 300 hands and will be one of the largest plants of its kind in the West.

THERE is good promise of a strong State association of master steam fitters in Connecticut. Already over 30 firms have taken the action which insures their membership. The movement is being made by the same men who have brought the State Association of Master Plumbers into such a flourishing condition.

L. R. BLACKMORE, manager of the New York house of the Craig-Reynolds Foundry Company, Dayton, Ohio, has recently been granted a patent for a house heating boiler of the vertical section type.

GLOBE STEAM HEATER COMPANY have been incorporated at North Wales, Pa., with a capital of \$45,000. The directors are Hosea K. Kriebel,

Reuben O. Kriebel, North Wales; Frank M. Dampman, Philadelphia; Harry A. R. Dietrich, South Bethlehem, and Andrew J. Lyon, Norwich, N. Y.

C. V. KELLOGG, treasurer of the American Boiler Company, 84 Lake street, Chicago, has returned from a trip to New York and Baltimore.

THE S. WILKS MFG. COMPANY, 113 to 123 South Clinton street, Chicago, have lately shipped two large heaters to San Francisco, two for the United States Barracks at Baltimore and have received large orders from Kansas City, St. Paul, Omaha and other points East and West.

CLARENCE M. WOOLLEY, secretary of the American Radiator Company, Chicago, visited the New York office, at 92 Centre street, this week. Mr. Woolley looks well and is pleased with the reception of the new Varona radiator by the trade. Another of their attractions is the Italian flue semi-direct box base radiator, arranged for either bottom or back opening for the air supply.

W. P. DAVENPORT of the Exeter Machine Works, Exeter, N. H., this week visited their New York agents, Lockwood & Adams, at 143 Centre street, in the interest of their line of Exeter radiators. A satisfactory business is reported.

The Peerless Gas Generator and Burner.

The Peerless Gas Generator & Burner Company, 503 Hamilton Building, Pittsburgh, Pa., are putting on the market the Peerless hydro-carbon gas generator and burner shown in the accompanying illustration. The burner shown is designed for use with cooking stoves, but other sizes and styles of

The Peerless Gas Generator and Burner.

burners are also made designed for use in hot air furnaces and house heating boilers. It is claimed that the burner will generate gas from the lowest and cheapest grade of refined oil. In operation the oil is put in a 29-gallon tank placed either in the cellar or on the floor beside the stove, and it is said that it works best when the tank contains not over 5 gallons of oil. An air pump and pressure gauge is connected at the top of the tank, and the space in the tank above the oil is filled with air until a pressure of about 5 pounds is shown. This forces the oil into the burner. In lighting, a sufficient quantity of oil is run into the tray under the burner to heat the burner thoroughly after it is lit. When the burner becomes hot the oil passing through it is generated into a gas and issues from an aperture into an air mixing chamber leading to a burner, from which a blue flame of intense heat issues. It is stated that it can be started ready for cooking in one minute, and that one of these burners placed in an ordinary cooking stove will furnish sufficient fire to bake, broil or do any of the other work of the kitchen to the entire satisfaction of the cook. One gallon of oil is said to run the stove for ten hours and generate sufficient heat to warm a large room in zero weather. The company also furnish a list of insurance companies who make no objection to the use of this system of oil burning.

Jupiter Hot Air Furnace.

The Tubular Heating & Ventilating Company, 228 Quarry street, Philadel-

into the furnace at the air inlet. Entering the tubes at their lower ends, it is warmed by the waste products of combustion as they enter the smoke flue, and becomes hotter in its passage

rect heat. The course of the products of combustion is easily seen. Following an upward course from the fire they are diverted by the upper tube sheet downward along the tubes until they meet two baffle plates, which compel them to take a zigzag course to the smoke outlet. The manner of exit allows of the waste products of combustion being utilized to warm the cold air at point of entry.

The makers claim that the furnace is made of the best materials and is absolutely gas tight. It is easily cleaned or inspected when required, the name plate on the front of the boiler sliding upward to allow of access to the tubes. A door in the front of the hot air chamber and above the name plate gives further access, so that every part of the furnace may be conveniently examined. The makers claim for this furnace an advantage over other furnaces in that it is adapted for use in the shallowest cellars; that economy in fuel is obtained on account of the fact that 88 per cent. of the heat units in the coal is utilized for heating air, and that it is cheap, compact, most durable, and, when required, easily repaired. The furnace is made in seven sizes, and Reeves & Smiley, 129 North Second street, Philadelphia, have been appointed agents for Eastern Pennsylvania, South New Jersey, Delaware and Maryland.

Jupiter Hot Air Furnace.—Fig. 1.—Front View.

phia, are putting on the market the Jupiter hot air furnace, shown in the accompanying illustration, which embodies a direct departure from the lines usually followed in furnace construction. Fig. 1 is a front view. The scale on the left shows the height of the furnace to be 4½ feet, and it is stated that the largest size made does not exceed 5 feet in height. The side of the furnace is of crimped galvanized iron casing and wrought iron base. Fig. 2 is a sectional view. It will be seen that the inventor has adopted some of the ideas embodied in the well-known Babcock & Wilcox boiler and adapted them for use in connection with hot air. The tubes shown are ordinary 2-inch boiler tubes, packed into cast iron sheets or heads at top and bottom. A steel back plate ¼ inch thick extends the length of the tubes, and with side plates of the same thickness, and the front, made of ½ steel plate and cast iron frame, practically incloses the furnace proper and makes a large combustion chamber. The remaining space within the casing is conveniently utilized for hot air chamber and dead air spaces. A smoke flue enters the back plate on a level with the fire door, the damper being operated from the front of the furnace by the rod with ring handle seen at the right of the fire door. The grate is constructed on the rocking principle, and by unshipping the lever and pulling out the rod it can be made to dump clinkers and ashes quickly and effectually. A thin steel plate laid over the cellar floor gives a smooth surface to the bottom of the ash pit. The fire box has a lining of fire brick 3 inches thick. Back of this fire brick lining on all sides is an air space which allows air entering the ash pit door to pass upward around the fire, thus mingling with the gases and increasing the efficiency of the combustion. In operation, cold air is taken

upward until reaching the top tube sheet, which is the hottest part of the combustion chamber, where it emerges

The necessity for improving harbor accommodations in order to suit the large modern steam vessels is pressing itself upon a number of the Atlantic ports. The city of Philadelphia is projecting some improvements in the harbor on the Delaware River, which will include among other features the construction of four piers of sufficient size to accommodate the largest ocean going steamers and ranging in width from 80 to 100 feet. Boston also is contemplating some extensive improvements in the docks in that

Fig. 2.—Sectional View.

into the hot air chamber. The makers lay much stress upon the fact that the hot air enters the service pipes immediately after receiving the greatest di-

city, to accomplish which from \$10,000,000 to \$15,000,000 will be required. This involves a new dock system at East Boston.

STOVE TRADE NOTES.

The Aqua Retort Heater.

A very interesting line of heaters is being brought out by the Portsmouth Stove & Range Company of Portsmouth, Ohio. It covers two general classes, one known as the Ariel Retorts and the other as the Aqua Retorts. The former is a parlor heater, while the latter is a parlor heater with a hot water attachment. The trade will be interested in the sectional view of the latter which is presented herewith and which illustrates the internal construction and method of burning fuel in both classes of stoves. The hot water attachment is a chamber in the middle of the stove, as shown. The notable feature of the apparatus, however, lies in the method of burning the fuel, the stove being especially adapted for soft coal, slack, nut and other cheap fuels, the particular purpose of its design being for the use of Dakota lignite. The coal is put into the retorting chamber at the back of the stove, from where it gradually drops down as it burns away from the bottom. The draft enters below the fuel, returning through the grate, which is placed in a slanting position at the back, the flames being carried toward the front of the stove and up in front of the water chamber. The manufacturers point out that Dakota lignite requires a large volume of air for its perfect combustion and in this stove ample provision is made for regulating the supply and also checking the draft in case there is too strong a draft in the chimney. Special features of this stove are the mica frames on the outside of the door and the mica front, which gives a very large illumination. The principal regulation is done at the ash pit, where the entering air is controlled. A further control, however, is afforded by the check damper at the top of the flame chamber.

The Brand Stove Company

of Milwaukee, Wis., have issued from the press a catalogue of stoves, ranges, and heaters which is of a shape, style and make up differing somewhat from the average stove trade publication. It measures about 6½ x 9 inches and contains 112 pages bound in paper covers. The side title carries a pretty design, the central feature of which is the name and address of the company embossed in old gold upon a light blue ground. Another feature is a *fac-simile* of the company's trade-mark printed in the same colors. The first page of the publication contains the announcement that the entire product of the company, embracing ranges, cook stoves, heaters, furnaces and gas and oil burning constructions, will as a whole be known under the single term of "Brand's Famous," this general designation being prefixed to the individual name of each stove. The opening pages are devoted to illustrations of the company's works in 1868 and in 1895, prices, terms telegraphic code, directions for operating stoves and ranges, &c. Brand's Famous steel range, made of steel plate of a double thickness around the sides and back of the fire place; ventilated oven with removable bottom; steel oven door; fire box lined with cast or fire brick linings; large flues and warming closet provided

with patent revolving door which cannot get out of order, is given the leading place. Following this is Brand's Famous Edison six-hole range, for hard coal or wood, made with sheet flue, large oven, draw center or duplex grate, patent oven door opener and other features of utility and convenience. The Brand Famous Fireside range, made for all kinds of fuel and

Famous Crescent range, for soft coal or wood, was brought out in recognition of the need, especially in all sections where soft coal is used as the prevailing fuel, "of an article in whose construction the predominating elements would be size, durability, finish of workmanship, weight of exposed parts, ease of operation, economy of fuel and a due regard of exterior." A number

Sectional View of Aqua Retort Heater.

having four and six boiler holes, comes next in order. An interesting feature of this stove is its ornamentation, of cast scroll design, all visible parts being cleverly treated. Another peculiarity is the oven, which projects beyond the base, being well shaped and ventilated, while the oven door covers the entire side of the stove body. Other features are detachable pedal attachment, draw out drop hearth, duplex grate and interchangeable back which converts a square stove into a reservoir and *vice versa*. The oven top and the main bottom plates are ribbed and cemented, the damper and handle are detachable and the reservoir is flush. Brand's

of careful tests have been made by the company as to the relative cooking power and fuel consumption of this range, with very satisfactory results. The Crescent embodies the modern features and all sizes are adapted for hot water connections. Among the other goods shown may be mentioned the Goldbrand, a six-hole range adapted for hard coal or wood; the Dandy, a low priced six-hole range; the Fireside, made with both four and six holes and adapted for burning wood only, this being ornamented in the same manner and style as the coal range made under the same name and previously described, and the Gold Dust, a four-

hole range for wood only. The cook stoves are represented by the Fireside, Crescent, Chief and Gold Dust. The heaters occupy a number of pages which follow, being represented with Brand's Famous Aurora in the leading place. This is a handsome parlor heater of very neat design and embodying the latest improvements. Brand's Famous Art, Brand's Famous Brilliant and Brand's Famous Junior are adapted for burning hard coal and are offered in a variety of styles and sizes. A varied assortment of sheet iron cylinder surface burners, oak, laundry, cannon, cottage parlor and box stoves are also illustrated. Brand's Famous gas range improved for 1895 is described, as well as a line of hot plates, oil stoves and heaters and a line of warm air furnaces, including the Florida, Wisconsin, Comet and Magnet. An index to the telegraphic code, as well as a general index and blank pages for the purpose of memoranda, complete the catalogue.

Ventilation.

BY GEORGE PHILLIPS, VANCOUVER, B. C.

I notice with considerable interest the large amount of valuable space allotted weekly to the pros and cons of proper sanitary ventilation of public and private buildings, especially that of schools, and perhaps a few lines of what we are doing in this far off West in that direction may be found of some interest to the readers of *The Metal Worker*. As S. A. Heins adds remarks in *The Metal Worker* of June 1, one of the greatest drawbacks is the extra expense incurred when ventilation is considered, and you will often see, especially in the suburban and small districts, a crowded schoolroom, with a common stove to do the heating, and open, drafty windows the ventilation. Now, if those same windows would only take off the foul or carbonic acid laden air, which it is absolutely necessary to be rid of before we can properly ventilate, the case would be different. Instead of this the children are absorbing the poisonous air, while the fresher and more pure air is allowed to escape through the open windows, at the same time causing innumerable coughs and colds to their delicate systems. In my mind there is no subject in this advanced age of ours that has been more neglected.

This subject drew my serious attention some years ago, while engaged in the stove and furnace business, and daily observation has led me to believe that no better or cheaper method of ventilation has as yet been provided than the old open fire place, and the heat ordinarily wasted in the chimney can be largely utilized for supplying fresh air by placing a specially adapted and constructed air heating drum or chamber in the chimney above the fire place. It is a comparatively simple matter to arrange in the chimney an efficient means of checking the waste of heat and supplying a liberal amount of fresh warm air from the outside to take the place of the vitiated air, which is in the meantime being drawn away by the open fire place. We have the remedy for the whole difficulty in a nutshell, at a small cost of both fuel and introduction. To give an example of how far I have succeeded, I may mention one in particular, that of a ward in the City Hospital of Vancouver. The ward measures 57 feet long, 40 feet wide, with 13 feet 6 inches height of ceiling, or, in other words, containing 30,780 cubic feet of space. The whole is thoroughly heated and ventilated with one fire place, to the entire satisfaction of the management thereof, at a total cost of \$140 for apparatus.

I am now about to place the same system in one of our new schools. The contract is to thoroughly heat and ventilate the four classrooms (each containing 10,000 cubic feet of space) with two fire places, and as two of the classrooms are directly above the others, I use the fire place as a ventilator for the lower rooms, with an 8 x 12 register placed near the ceiling supplying the hot air, while in the upper rooms I place a 10 x 12 register in the same line of the fire place near the floor, which, in conjunction with an 8 x 12 register supplying hot air near the ceiling, causes the complete circulation for each room, at a total cost of \$212 for apparatus, with an after cost of much less fuel than either furnace or stoves, as well as giving a proper ventilation.

The Manufacturers' Stove Repair Company

have recently been incorporated and organized at Chicago for the purpose of making and selling repairs for all classes and grades of stoves. They have established their office, salesroom and warehouse at 2810 Logan street, immediately adjoining their foundry. It is not altogether a new enterprise, as the company succeeded to an established business, which gave them a large stock of patterns with which to make a start. They now have on hand patterns for the repairs for 10,000 stoves, and it is their purpose to add more as rapidly as possible. The members of the company are practical founders who have had long experience in the business, and who expect by close attention to all details and the introduction of the most systematic methods to put themselves in a position to handle a very large part of the stove repairing business of the West. Many manufacturers of stoves will doubtless find it to their advantage to order repairs from this company, who, by making a specialty of the business, can much more rapidly and easily furnish odd parts. The company have prepared order blanks which they will be pleased to furnish those who wish to order repairs. These blanks are of a character to indicate so specifically the kind of stove for which repairs are made that there is no possibility of errors, and the order will thus be certain to be filled exactly in accordance with the desire of the purchaser. The telephone address of the company is Canal 364. They are also dealers in fire brick, Rutland cement, crated cement, stove polish, door knobs, mica, dampers, &c.

The Bramhall Deane Company

of 262-266 Water street, New York City, have issued from the press an illustrated catalogue which is among the largest publications of the kind reaching our desk this season. It is an oblong volume measuring 94 x 134 inches, consists of nearly 200 pages of letterpress, and is bound in paper covers. In their introduction to the trade the company call attention to their complete assortment of culinary appliances, which is presented in the volume, and state that the most valuable improvements in this line have been introduced by them in the last 35 years, in which they have been engaged in the business. Reference is made to the special features which are constantly being added to their goods, all being in the direction of economy of fuel and durability. For a long time the company have manufactured their own brass work and have recently put in a nickel plating plant. An interesting feature of the volume is found on page 5, which shows an interior view of the kitchen

of the Holland House, New York, as furnished by the company. Deane's patent French range occupies a number of pages, it being made in several sizes adapted to meet requirements from the smallest up to the largest. The 6-foot range, having one fire and two ovens, is designed especially to meet the requirements of those wishing a stove with only one fire, yet having great oven capacity. One of the sizes having two ovens is made for burning wood as a fuel. Many additions have been made to this line of ranges, all of which are of first-class construction and substantial appearance. Instructions for setting Deane's patent French ranges, accompanied by sectional views showing how the work is done, form a feature which cannot fail to prove interesting to dealers generally. A line of yacht ranges and boilers, made in sizes from 2 feet long upward, is shown and a partial list of yachts using the company's goods is presented. There is also shown a view of the style of range which has been selected for the yacht "Defender," following which is a view of the pattern of range with which some of the United States cruisers are fitted. Among the additions to the company's assortment of goods is a new gas oven known as the Brilliant. This is made of heavy sheet steel, with polished wrought iron trimmings, and drip pan of heavy galvanized iron. A long line of chop house broilers, cooking ranges for hotels, portable ovens, oyster ranges, dining car ranges, portable French ranges for soft coal, and pastry ovens, a new laundry range with drying room equipment, laundry stoves, tailors' irons, water heaters and improved hot water apparatus for heating brooder houses accompanied by numerous testimonials, upright tubular boilers, as well as an extensive line of miscellaneous goods, such as tinware of various kinds, hollow ware, Dutch ovens, kitchen clocks, potato peelers, water sterilizing apparatus, plate warmers, carving tables, water urns, caldrons, oyster cookers, Imperial egg boilers with time cups, steam closets, cast iron steam jacket kettles, &c., are also presented. The closing pages of the catalogue are given up to cutters of different kinds, copper and lead molds, and a very comprehensive index alphabetically arranged. The volume gives evidence of a great deal of care in its preparation, and in connection with the various illustrations is to be found more or less descriptive text.

ODD PLATES.

THE Smith & Anthony Company of 48-54 Union street, Boston Mass., have brought out the Hub steel range, which is offered in several styles and sizes. This range embodies a number of interesting features, possessing large fire box, capacious oven, drop oven door and duplex grate. The latter can be readily withdrawn or replaced without disturbing the stove or removing a single plate or bolt. The material used in the construction of the body is cold rolled steel, asbestos lined throughout. The top is made of heavy cast iron cut in four sections. In the smallest size the oven measures 22 x 16 inches, in the next size 22 x 18 inches, and in the largest size 22 x 20 inches. The Hub is of neat appearance, being attractively decorated with nickel and polished iron. It is fitted with all the usual attachments, such as hot closet, shelves, and reservoir, water front, &c. The closet is very commodious and is easily reached through a rolling door.

NEW ATHENS FOUNDRY, New Athens, Ill., are sending to the trade illustrated circulars describing their New Pearl heater for wood. This stove is referred to as being of the very latest

design and pattern, and the sales already made are mentioned as being phenomenally large. The circular contains a sectional view of the stove, showing the interior construction and its method of heating. It will burn anything, from light shavings to the heaviest wood, and will keep fire over night. This company are also sending out a large circular containing engravings and description of some of the goods which they manufacture. Prominent among them we notice the Challenge range for coal or wood, made in four sizes, either plain or with bracket reservoir, or reservoir and hot closet. Engravings are also shown of Our Charm, New Princess and Okaw, all of which are adapted for coal or wood. The Excelsior, for wood only, is a neatly designed cook stove, made in four sizes. A few of the heating stoves shown are as follows: Grit Oak, a low priced oak stove; Okaw, a medium priced cannon stove; Okaw, box stove of recent design, and a full assortment of laundry stoves.

The Bellaire Stove Company, Bellaire, Ohio, will soon have ready for the trade a neat booklet, directing attention to their new Star air tight heater, for which many points of excellence are claimed. It is the intention of the company to give this booklet wide distribution, and it is suggested by them that dealers do not place their contracts until they are fully acquainted with the merits of this new heater.

The Portsmouth Stove & Range Company of Portsmouth, Ohio, have brought out a very attractive parlor heater, known as the Ariel Retort. It is intended for burning soft coal, and is referred to by the manufacturers as having the largest mica illumination ever put in a construction of this kind. The stove has large radiating surface, is powerful in operation, and so made that it is said to be impossible for gas to escape into the room. The combustion is referred to as being entirely satisfactory, the fire being uniform and continuous, and the flues not becoming clogged.

The Buckwalter Stove Company of Royersford, Pa., and with sales agents in Philadelphia, Chicago and Baltimore, are making the Colossus full reversible flue base burner in three sizes with 11, 13 and 15 inch fire pots. This stove is of neat and attractive ornamentation, and is offered both as a single and double heater. The company are also inviting attention to their Art Ringgold, a medium price base burner with either straight draft or full reversible flue. Either style is made in three sizes with 10, 12 and 14 inch fire pots. These two heaters are referred to as embodying all the desirable features, and as being first class in every respect. The catalogue which the company have issued contains illustrations and full descriptive particulars.

A SUIT was brought last week in the Circuit Court at Springfield, Mo., in which is involved the title to the plant of the Springfield Stove Works, at that city. The suit was instituted by George H. Sease and other citizens who had subscribed for the building of the foundry, and they asked that the property be reconveyed to them on the ground that the company had failed to comply with the terms of the contract respecting the number of hands to be employed. According to reports in the local papers the people of Springfield bought the old cotton mill plant east of the Phelps avenue depot, and conveyed it to the stove company with an agreement that the factory should be operated continuously for five years, and that the force employed should at no time fall below 50 molders and 100 men in the aggregate. W. W. Baldwin, who

received the bonus to construct the works, testified in part that the necessary workmen could not be found to make good the promise of the company in the particular named. Able counsel were employed in the case, which, up to the latest advices, had not been decided.

The Ridgway Furnace Company of 6 Portland street, Boston, Mass., have issued a 48-page pamphlet neatly printed on good paper and bound in paper covers containing records of some of the results obtained by the Ridgway revolving open fire pot heater. This furnace is described somewhat in detail, the text being accompanied by broken views of the heater showing the general arrangement of parts. There are also given tables of dimensions covering the various sizes in which the heater is made. The bulk of the matter, however, is in the nature of testimonial letters from some of those who have used the company's goods. There is also a long list of names and addresses which are offered as references in the same connection. The Ridgway furnace is referred to as a powerful heater, economical, easily handled and simple in construction.

The Foster Stove Works of Ironton, Ohio, propose to open, July 4, a branch in Louisville, Ky., with L. E. Marting, secretary of the company, in charge. A building 25 x 80 feet in size and three stories and basement in height has been rented for the purpose, and during the past week shipments of stoves have been made to stock the new house. The branch will be made a distributing point for the Southern and Western trade, and is established in the interests of an expansion of business.

The Champion Steel Range Company of Cleveland, Ohio, have appointed the Chicago Stove & Range Company, Chicago, Ill., agents for the Western States.

The Fischer-Leaf Company of Louisville, Ky., are very busy at their foundry, and week before last they shipped five carloads of stoves into the State of Texas. Last week they sent forward ten more cars loaded with stoves, grates, mantels and fancy articles. The present rush is caused by prospective advances in freight rates, but the company are also preparing for a good fall trade.

The Chicago office of the Peninsular Stove Company inform us that they have just made a shipment of Peninsular wrought steel ranges to Valangin près Neuchatel, Switzerland.

J. S. STANBROUGH of Oswego, N. Y., has issued a directory of stoves and ranges which he has sold in Oswego and vicinity. The pamphlet contains among the early pages illustrations, with brief descriptive particulars, of the P. P. Stewart and Eastern Stewart ranges, having patent oval fire box and interchangeable draw center, triangular or dock ash grates. The ovens are of large size, well shaped and thoroughly ventilated, while the ornamentation is of an attractive character. There is also shown the Splendid Stewart square parlor heater, arranged for burning anthracite coal. It is made in three sizes and fitted with duplex grate. The pages which follow are given up to an alphabetical list of some of the people in Oswego and vicinity who are using these stoves and ranges made by the Fuller & Warren Company.

GIBLIN & Co., Utica, N. Y., favor us with a copy of an illustrated circular which has just been issued relating to the Standard steel furnace. The heater is illustrated by means of a

broken view showing the internal arrangement of parts and accompanied by full description and table of dimensions showing the sizes of fire pots, radiators, casings, &c., of the various sizes in which the Standard is made. The heater is intended for using coal, wood or gas, and is referred to as being low in height and in price; quick in operation and powerful in construction.

G. D. FERRIS, 813 North Twenty-first street, St. Louis, Mo., is offering the trade what is known as the Queen heater, arranged to burn wood or coal. The Queen is made this year a trifle larger at the bottom, which is said to improve its appearance and enables a number of the bodies to be nested together. An edge is turned on the bottom of the stove body as well as on the stove bottom, so that any one can slip the bottom on and hammer and edge down in a few minutes. It is stated that six stoves will nest together, thus effecting a large saving in the cost of transportation, while there is less danger of damage in transit.

The Somerset Stove Foundry Company of Somerset, Mass., are bringing out the patterns for nine parlor heaters to meet the requirements of their growing trade. The patterns include three sizes of the Somerset Grand parlor, a first-class construction in every respect, combining with the good qualities of the renowned new Somerset and Arion parlors the very latest improvements. These will be followed by three sizes direct draft, as well as the same number indirect draft, and will be known as the Somerset Jewel. The company will also place on the market a new range which will represent their best efforts, and which, with their present lines, will give them an assortment of goods well adapted to the requirements of the New England trade.

The Jackes-Evans Mfg. Company, St. Louis, Mo., issue a circular illustrating their Acme and Crown wood heaters. The Acme is made with Russia iron body, with heavy steel lining, and has a swing cover which it is unnecessary to remove when putting in fuel. The stove also has a cast swing damper door for the easy removal of ashes with an ordinary fire shovel and a cast pipe collar which adds to the strength and durability of the stove. The design and construction of the damper on the Acme are patented. One size of the Crown heater is 29 1/2 inches long, 16 inches wide and 20 inches high, having a body of Russia iron with steel lining. The other size is 25 inches long, 15 inches wide and 18 inches high, the body being of Wood's smooth steel, and in other respects similar to the stove just described.

J. ELWOOD YEAGER, 56 North Second street, Philadelphia, is sending to the stove trade a blank for ordering stove repairs, leaving space for the name of the manufacturer, number and name of stove, and the date and style of grate. Stamped on the blank is the notice, "Do not order repairs for different stoves on the same blank."

AN interesting match game of baseball will be played at the country seat of W. McDowell, secretary of the Liebrandt & McDowell Stove Company, Philadelphia, at Narberth, Pa., on Saturday afternoon, between teams from the stove houses of J. Elwood Yeager, captained by Mr. Yeager, and F. M. Borden & Bro., captained by W. F. Habicht. It is expected that a large delegation from the Philadelphia stove trade will visit Narberth to witness the encounter. The game will be umpired by Adolph Grant of the stove and furnace house of Adolph Grant & Co., 1901 Germantown avenue, Philadelphia.

The Magee Furnace Company, Boston, Mass., have decided to close out their branch houses in Chicago and New York, and, we understand, are prepared to negotiate for the agencies of their various manufactures in these cities, with or without stock of goods, lease, &c., now on hand. They mention that business has been successfully carried on at these points for the past 30 years or more, and their offer gives an excellent opportunity for any one desiring to start in business or add to an already established trade.

FRED. W. GARDNER, the Western manager of the Michigan Stove Company, received a visit the other day at Chicago from Senator A. T. Stebbins of Rochester, Minn., who has been his patron for over 20 years. Senator Stebbins was on his way to Cleveland as a delegate to the convention of the National League of Republican Clubs. He had been a member of the House of Representatives of Minnesota for some time, and last year was elected to the Senate by an overwhelming majority, which was a pleasant index of his popularity in that section.

The New York Nickel Plating Company, 229 West Twenty-ninth street, New York, are placing on the market a new stove knob which they call the Always Cold, which is made of malleable iron. The knob is made as a cored casting and is very light in weight. It is constructed to permit a free circulation of air to prevent its being heated to a high temperature. In addition to manufacturing these goods, they make a line of solid cast knobs, hinge pin tips and draft slide knobs. They also have a well equipped machine shop for light manufacture, and at the present time are engaged in making a slot machine for the sale of perfumes. A large portion of their business is nickel plating for their customers. They have been busily engaged during the last few months, and have increased their capacity, having added 350 gallons of nickel solution and 700 gallons of copper and brass solution to their plant. They occupy three floors of the building, which is 40 x 100 feet, using the first floor for an office and solution tanks, and the upper floors for machine shop, polishing and finishing rooms. They also manufacture for special customers a line of nickel plated castings, one of the features of this branch of their business being the superior finish and softness of the castings which they furnish.

The Manufacturers' Stove Repair Company, 2810 Logan street, Chicago, are sole agents for Perry & Co. of Albany, N. Y., and carry a full line of their original repairs in stock.

NOTICE has been given that an application will be made July 16 to incorporate the Charles R. Sayre Company of Montrose, Pa., formed for the purpose of manufacturing hot air furnaces, feed steamers, house furnishing goods, &c. The incorporators will be Charles R. Sayre, Daniel Sayre, W. D. Lusk, Franklin Lusk and Searle McCollum.

TRADE NOTES.

The Steel Edge Stamping & Retining Company's works, at Millis, Mass., have been sold at auction to John S. Folsom for \$26,000.

The American Novelty Mfg. Company, to manufacture metal goods in Brooklyn, have been incorporated, with a capital of \$4000. The directors are Charles Hart, James Denehan and Edward C. Kruz, of Brooklyn.

The proprietors of the National Galvanizing Works, McKeesport, Pa., are considering the advisability of removing their plant to Glassport, on the

McKeesport & Bellevue Railroad, where they have been offered a free site. The reason for the projected move is the enforced enlargement of their plant in order to meet their growing business, and the difficulty in obtaining suitable ground at McKeesport.

The American Sheet Iron Works of Phillipsburg, Pa., have made an advance of 10 per cent. in the wages of their employees, taking effect July 1.

The McKeesport Iron Works, of the W. Dewees Wood Company, McKeesport, Pa., are being operated full time in all departments, the firm having a large number of orders on hand.

W. R. OSTRANDER & Co., 204 Fulton street, New York, issue a revised catalogue. The book contains 191 pages and relates to Speaking Tubes, Electric Call Bells, Electric Burglar Alarms, Electric Lighting, Electric Gas Lighting, Electric Fan Motors, Electric Specialties, Watchman's Clocks, Telephones, Telegraph Supplies, Mechanical Door Bells, Pneumatic Call Bells, &c. The illustrated catalogue and price-list contains a complete list of the company's manufactures.

HEATING & PLUMBING.

NEW WORK AND CONTRACTS.

The Connecticut Legislature has authorized the expenditure of \$2500 for the heating and ventilation of the Normal School Building at New Britain.

Geo. Mahl, Hartford, Conn., is doing the plumbing in an \$8000 residence for A. I. Jacobs.

The Pawtucket Steam & Gas Pipe Company, Pawtucket, R. I., bid \$1500 and secured the contract for heating and plumbing the new High School.

Councilman Dahlborg, Brockton, Mass., has the contract for plumbing Edwin Keith's cottage at Monument Beach.

G. M. Rossmann, Keene, N. H., is putting a steam heating apparatus in F. K. Burnham's house.

The Building Committee of the Board of Supervisors of Linn County, Iowa, at Cedar Rapids, were authorized to make contracts for the erection of a suitable building for water closets and also for heating the county buildings with steam.

W. H. Bryan, chosen by Architect Mann to select a heating system for the new City Hall, St. Louis, reported to the new City Hall Commission in favor of the indirect hot blast system in rooms much frequented and the radiation system in others.

Spriggs, Black & Co., Grand Forks, N. Dak., have the contract for the steam heating apparatus to be placed at the Garfield Roller Mills, at Fertile.

Gray, Rippey & Suter, Sedalia, Mo., have the contract for putting in a steam heater at Baird College, at Clinton. This, it is said, will be one of the largest and most complete heating systems in Central Missouri.

The George A. Underwood Company of Boston have the contract for the heating and ventilating of the Northend School, at New Britain, Conn.

Peter Leudroth, New Haven, Conn., will build two store buildings that will be heated with hot water.

The G. W. Hazel Company, New Haven, Conn., will do the plumbing and heating in the new residence of Frank Cowee.

O. S. Wright, New Haven, Conn., has the plumbing contract for the new house of J. Dickinson.

J. J. Hugin, New Haven, Conn., has the contract for plumbing the new house of J. Wahrreuberger.

The heating and plumbing contracts have not been let for the house of M. Foote, New Haven, Conn.

The heating and plumbing contracts have not been let for the new house of Thomas L. Scott, Bridgeport, Conn.

Sheahan & Groark, New Haven, Conn., have been awarded the contract for the

heating of the new Christ Church and for the Winchester School Building.

The Smith & Anthony Company, Boston, Mass., secured the contract for heating and ventilating the school at Northampton, Mass., at \$4974.

The School Committee of Manchester, N. H., awarded the contract for heating the Straw School to the Underhill Warming & Ventilating Company, Boston, and for the Wilson School to the Fuller & Warren Company, Boston.

The Idaho Plumbing & Heating Company, Boise, Idaho, have just received a contract for heating a new business block for Peter Sanna, in which they will use 3400 feet of Perfection radiation.

Sealed proposals will be received at the office of the Supervising Architect, Washington, D. C., until July 16, for a low pressure return circulation on steam heating and ventilating apparatus at the United States Post Office Building, at York, Pa. Drawings and specifications may be had from the Supervising Architect, Washington, or at the office of the superintendent at York.

C. A. Middlemas was awarded the contract for the plumbing and Washburn & Garfield were awarded the contract for the steam heating in the new surgical ward of the City Hospital, at Worcester, Mass.

At the town meeting of Westborough, Mass., \$3800 was voted for making alterations in the heating and ventilation of two school houses.

The contract for plumbing the St. Jean Hall was given to P. J. Liddy, Meriden, Conn.

T. J. Sanford, 5238 State street, Chicago, is to do the plumbing and drainage in the flat building of Max Alter, Forestville avenue and Forty-ninth street.

J. Murphy, 6805 South Halsted street, Chicago, is to do the plumbing and drainage in the residence of J. B. Thomas, 4364 Emerald avenue.

J. A. Johnston, 4706 Cottage Grove avenue, Chicago, has the contract for the plumbing and drainage in the residence of E. C. Morton, Union and Sixty-eighth streets.

J. R. Hayes, 423 State street, Chicago, is to do the plumbing and drainage in the residence of G. F. Orado, 2250 La Salle street.

William S. Verity, 229 West Randolph street, Chicago, has the contract for the plumbing and drainage in the residence of Samuel Brown, North Western avenue and Wilson street.

P. C. Desmond, 938 West Lake street, Chicago, is to do the plumbing and drainage in the flat building of J. Healey, 1054 West Madison street.

Park Bros., 79 Dearborn street, Chicago, have the contract for the plumbing and drainage in the flat building of J. Oleson, 86 Nebraska street.

Charles C. Breyer, 187 West Division street, Chicago, is to do the plumbing and drainage in the flat building of S. Samuels, 76 Potomac avenue.

Becker & Schirra, 643 Sedgwick street, Chicago, have the contract for the plumbing and drainage in the flat building of Otto Janneman, 648 Orchard street.

L. R. Bain & Co., 633 West Madison street, Chicago, are to do the plumbing and drainage in the flat building of George S. Ballard, Kedzie avenue and Harrison street.

Keefe & Warnock, 1105 Lincoln avenue, Chicago, have the contract for the plumbing and drainage in the two store and flat building of P. O'Connell, 406 and 408 Belmont avenue.

R. T. Ward, 1487 West Harrison street, Chicago, has the contract for the plumbing and drainage in the two flat buildings of H. H. Lamson, Kedzie avenue and Nineteenth street.

Hanley & Cassey, 21 Quincy street, Chicago, are to do the plumbing and drainage in the flat building of S. H. Taylor, 291 Dearborn avenue.

M. J. Lyons, 720 Forty-third street, Chicago, has the contract for the plumbing and drainage in the flat building of M. Foley, Forty-second and Sherman streets.

TRADE REPORT.

The Iron Market.

The upward course of prices has been emphasized by the advance of \$2 per ton on Steel Rails. This is partly due to the rise in Raw Materials and partly to the increased demand. Thus far, however, the Western mills have been the beneficiaries of the improvement in the demand. The Eastern manufacturers are awaiting the overflow. Billets have been marked up to \$20 to \$20.50 in the Pittsburgh district. Advances have also been scored in Wrought Pipes and Tubes.

Pittsburgh advices state that Coke prices seem to have settled down to \$1.25 per ton at oven, with reports current of offers to sell at \$1.15. An advance in coal miners' wages, now considered probable, would, however, advance the price of Coke smartly in accordance with the labor clause in all Coke contracts recently made.

It is decidedly reassuring to learn that labor troubles are not apprehended in the Western rolling mills on July 1. The Sheet and Tin Plate scales have been arranged to the satisfaction of all parties concerned, and the Bar scale is expected to go through without much friction. Business is too active to permit any interruptions such as might arise through labor troubles.

Pig Iron.—Consumers in the New York market are more thoroughly realizing the strength of the situation, and consequently transactions are larger. They have not yet overcome their disposition to shop, however, and are not quick to close contracts, but sellers are gratified to find them sending in orders after having declared their ability to do better elsewhere. Prices are not only firmly held, but sales of favorite brands have been made at rates above our quotations, which are as follows for the general market: Northern brands, No. 1, \$1.13; No. 2, \$1.12; No. 2 Plain, \$1.10 to \$1.15; all tidewater delivery. Southern brands, same delivery, are quoted at \$12.50 to \$12.75 for No. 1; \$12 to \$12.25 for No. 2; \$11.50 to \$11.75 for No. 3; \$12 to \$12.25 for No. 1 soft; \$11.75 to \$12 for No. 2 soft; \$11.25 to \$11.50 for Foundry Forge, or No. 4.

Advices from Philadelphia indicate that without any official announcement of an advance in prices the Pig Iron market is gradually working toward higher figures, and buyers would have to pay a little more money than a week ago. Foundry grades command \$11.50 for No. 2 Plain, \$12 for No. 2 X, and \$13 for No. 1 X. Some hold for still higher prices, and as the demand is in excess of the supply there is a fair probability that they will realize all that they ask. The demand is uniformly good, and taking everything into account prospects are of the most encouraging character. General quotations are about as follows for Philadelphia delivery and very close to the same figures at interior points:

Standard No. 1 Foundry X.....	\$12.75 to \$13.25
Standard No. 2 Foundry X.....	\$11.75 to 12.00
No. 2 Plain.....	to 11.50

Sales of Pig Iron in the Chicago market during the week do not aggregate the tonnage of the previous week, but the market cannot be called dull. The demand for local

Coke Irons in lots of 100 tons and one sale of 5000 tons exceeded the expectations of the greatest enthusiast of the upward move in prices. The advance last made on Coke Irons has been a stimulant to the Charcoal trade. Furnacemen claim a shortage in the supply of No. 1 Coke Foundry and somewhat that they are sold up to the end of the year on this grade. Southern furnace agents report an increasing demand for Softeners and an advance of 50c. per ton on some special brands. Indications are very favorable for continued activity. Quotations are as follows, for cash:

Lake Superior Charcoal.....	\$13.00 to \$13.50
Local Coke Foundry, No. 1.....	11.50 to 12.00
Local Coke Foundry, No. 2.....	11.25 to 11.50
Local Coke Foundry, No. 3.....	10.75 to 11.00
Local Scotch No. 1.....	11.50 to 12.00
Ohio Strong Softeners, No. 1.....	12.75 to 13.25
Southern Silvery, No. 1.....	12.75 to 13.25
Southern Silvery, No. 2.....	12.25 to 12.75
Southern Coke, No. 2.....	11.50 to 11.75
Southern Coke, No. 3.....	11.25 to 11.50
Southern, No. 1 Soft.....	11.50 to 11.75
Southern, No. 2 Soft.....	11.25 to 11.50
Alabama Car Wheel.....	16.00 to 17.00
Jackson County Silvery.....	13.00 to 15.50
Other Ohio Silvery.....	14.25 to 14.50

In the Pittsburgh district Bessemer Pig Iron is fully as strong as at any time since prices began going up. Sales during the week have been large. Foundry Iron, however, has not responded to the higher prices or heavy demand for other grades. Quotations are as follows, for cash:

No. 1 Foundry.....	\$12.50 to \$12.75
No. 2 Foundry.....	11.75 to 12.00

Less excitement has attended the purchase of Pig Iron in the Cincinnati district during the past week and the aggregate sales are not so large, but the market has lost nothing in tone; in fact, Southern furnaces have been debating the advisability of another advance, but a conference with sales agents seems to have convinced them that for the time being such a step would tend to unsettle rather than improve the situation. The large buyers who have been in the market recently have been anxious to purchase for as long deliveries as possible, and instances are noted where contracts have been placed even for the entire year, but at an advance of 25c. per ton over the present established prices. It is stated that a block of 30,000 tons of various kinds of Iron, mainly Foundry grades, held by a Northern furnace, has been sold recently, thus relieving the market of a heavy load. Quotations are given as follows:

Southern Coke, No. 1.....	\$11.00
Southern Coke, No. 2.....	10.50
Southern Coke, No. 3.....	10.25
Southern Coke, No. 1 Soft.....	10.50
Southern Coke, No. 2 Soft.....	10.25
Ohio Soft Stone Coal, No. 1.....	\$14.50 to 15.00
Ohio Soft Stone Coal, No. 2.....	14.00 to 14.50
Lake Superior Coke, No. 1.....	12.50
Lake Superior Coke, No. 2.....	10.75 to 11.50
Tennessee Charcoal, No. 1.....	14.00 to 14.25
Tennessee Charcoal, No. 2.....	13.00 to 13.50

The situation in the Pig Iron trade at St. Louis is reported as continuing to show steady improvement, and a heavy business is noted at the recent advance. Consumers who deferred purchasing their supplies in anticipation of a lower market have about concluded that there is no possibility of a reaction in prices and have accordingly entered the market, and are now assisting to maintain the recent advance by their purchases. Information from the

Southern furnaces induces the belief that another advance of 50c. per ton will take place shortly after July 1, so that it would seem like good policy for consumers to fill their wants at the present prices. The local consumers of Iron are all full of work, and there are enough inquiries on the market to lead them to anticipate a steady trade during the balance of the year. We quote as follows, for cash, f.o.b. cars St. Louis:

Southern Coke, No. 1 Foundry.....	\$11.50 to \$11.75
Southern Coke, No. 2 Foundry.....	11.00 to 11.25
Southern Coke, No. 3 Foundry.....	10.75 to 11.00
No. 1 Soft.....	11.00 to 11.25
No. 2 Soft.....	10.75 to 11.00

Metal Market

Pig Tin.—Speculation has been very slow the past week, and wholesale prices have fluctuated within narrow limits. In other words, it has been a feeble sea-saw sort of market, with net results too small to afford either "bulls" or "bears" a great deal of satisfaction. As far as the general situation is concerned there is no decided change. Consumption is good in this country and in Europe. Supplies are unusually heavy, and not a small part of the 10,000 tons or more lying in London is in speculators' hands, while the fresh supplies coming out from primary points are nearly, if not quite, equal to the world's consumption. At all events such has been the case this year up to the present time. Retail business shows considerable improvement. Small lots of Straits Pig from store are quoted at 15½c. to 15¾c. per lb.

Copper.—The market has changed somewhat for the better. The wholesale price for spot material stands higher than it did a week or two ago. This turn was brought about in part by announcement of the fact that a large block of Calumet and Hecla Copper has been taken for export at an advance of 4c. per lb. and that the company have raised their quotation to 11c. Electrolytic and Casting Copper have also improved in price and more business is reported. Jobbers' price for Lake Ingot in moderate sized lots is 11c. to 11¼c., and for G. M. B., 10¼c. to 10½c. per lb.

Sheet Copper.—The improvement in the demand for Manufactured Copper continues. Inquiry is good, and the volume of orders, although individually not very large, makes a good showing in the aggregate. Some considerable contracts for Cornice Copper are pending in this city. All the mills are busy on orders. The price-list on Manufactured Copper has not yet been advanced by the manufacturers, but some action in this direction is considered likely to be taken before long. Small lots of Sheet Copper from store are quoted at 14c. per lb. basis net.

Pig Lead.—Prices have remained almost stationary throughout the week, and business has been unusually slow for this season of the year. The general situation is practically as outlined last week—that is, statistically good in the West but more uncertain nearer this city and complicated by weakness in the London market that obstructs export business to greater or less extent. The price of American Pig in small

lots from store still stands at 3½c. to 3¾c. Bar Lead is quoted by jobbers at 4½c. to 4¼c. per lb.

Lead Pipe and Sheet.—A very fair business is being done in Manufactured Lead. As compared with the same period of last year, the number and extent of orders for Lead Pipe and Sheet show a considerable increase, and have been sufficient to keep manufacturers busy. Still, the volume is hardly up to expectations, nor do prices show the upward tendency which was anticipated, although they are stiffer in every line of Manufactured Lead. The outlook is regarded as favorable for an excellent volume of business in the coming fall. Lead Pipe in small quantities from store is firmly held at the list price of 5½c., and Sheet Lead at 6½c., subject to the usual discount.

Spelter.—The market shows more strength. Demand, while not extraordinarily liberal, has been more free, and prices are firmer. Galvanizing works are all very busy and their requirements are calculated to be large and growing for some time to come. Good Western brands, in small lots, are quoted at 4c. to 4¼c.

Sheet Zinc.—The demand for this material continues active and stocks are still rather light. Prices are well maintained. For 600 lb. casks, jobbers ask 6½c., and for broken lots, 7c. per lb.

Antimony.—Dealings have been moderate and prices remain fairly steady. Quotations for small parcels are 9c. for Cookson's and 8c. for Hallett's.

Nickel.—Sellers' quotations are 35c. to 37½c., according to quantity and terms.

Tin Plate.—While not quite as brisk as during last week, the demand for Coke Tin for future delivery has continued fairly large, with evidences of still further expansion. Prices are exceedingly firm, and for immediate deliveries, to fill absolute requirements, an advance of 5c. to 10c. a box is often asked and given. The price of ordinary Cokes now stands 15c. to 20c. a box higher than the recent lowest figures. The late heavy run on these Plates is attributed to delays on deliveries under old contracts, causing canners to go outside for enough material to fill their urgent needs. Stocks of both foreign and domestic Cokes are by no means full, nor does there seem much prospect of any material change in this respect in the near future. Domestic works are already crowded on contracts reaching to the early fall, and the Welsh mills appear more than likely to be seriously crippled in their operations by labor troubles after July 1. Foreign and American Plates are now selling at almost precisely the same terms, and consumers, as a whole, display little or no preference as to which class of Plates they use. American makers, being sold considerably ahead, refuse future delivery orders, except at a higher range of prices, in all lines of Plates. The demand for Roofing Plate is rather slack at the moment; but this branch of the market is likely to develop more strength later, as buildings now in course of construction are further advanced. A London cable dispatch of June 26 to *The Iron Age* reports on the British Tin Plate market as follows:

Tin Plate continues strong, and there is still a good business on the 9s. 6d. basis for Bessemer Cokes. Buyers have shown eagerness to place orders. Several makers have withdrawn quotations from fear of stoppage of works next month, owing to attitude of the leaders of the workmen. Meanwhile more works are being restarted in some districts on oil

sizes for America. Quotations, f.o.b. Wales, are as follows:

Bessemer Cokes, 10 14 x 20, 9s. 6d. to 9s. 7½d.
Siemens Cokes, 10 14 x 20, 9s. 9d. to 9s. 10½d.
Ternes, 20 x 28, 18s. to 22s. 6d.
Carbons, 10 14 x 20, 11s. to 13s. 6d.

Black Plate for tinning is strong at £7. 10s. for Bessemer and £7. 12s. 6d. for Siemens, f.o.b. Wales, and in good demand.

Sheet Iron.—The arrangement of the Sheet scale has given added strength to the market for Black and Galvanized Sheets. Mills continue very busy, and some are entirely out of the market for the time. Some jobbers who placed their orders when prices were very much lower than they are now are said to be offering Sheets at lower prices than the mills will accept. Nevertheless, the range of the market is higher and prices distinctly firmer. Galvanized Sheets are in very heavy demand, and can hardly be had for prompt delivery at any price. Small or moderate sized quantities of Galvanized Sheets from store are quoted at 70 per cent. off. No. 27 Common Iron in small lots rules at 3c. per lb. Black Plates for tinning purposes are firmer in price, and prompt shipments of this material are as difficult to obtain as are those for other descriptions of Sheet Iron.

Chicago Report.

Scrap.—Stocks are coming in very slowly and do not accumulate. Prices offered are about top price that can be paid for unsorted lots. Their buying prices are as follows, Chicago delivery:

	Per net ton.	Per lb.
No. 1 Wrought Scrap.....	\$3.50	
Machinery Cast.....	6.50	
Malleable Cast.....	7.00	
Stove Plate (free of burnt)...	4.50	
Burnt Iron and Grate Bars...	2.50	
Sheet Iron and Hoops.....	2.50	
Plow Steel and Breaking		
Stock.....	4.40	
No. 2, such as Shovels, Hoes,		
&c.....	3.00	
Old Boilers—whole (Iron)...	4.00	
" (Iron)—cut in single		
Sheets and Rings.....	6.50

CONDITION OF THE

Hardware Trade.

THE end of June approaches with an excellent feeling in the market, many heavy goods having a strong tone on account of the increased cost of the raw material. The rapid advance which has taken place in Wire and Cut Nails is perhaps the principal feature of the market, but in other lines there has also been a considerable advance in prices. The time of the year having come when travelers are being withdrawn from the road, there is naturally a falling off in business; but notwithstanding this fact there is a good deal of activity, and many buyers, large and small, are disposed to place orders earlier and more freely than usual. In the general line of Shelf Hardware there has been as yet but little improvement in the matter of prices, the demand not having yet reached its normal volume, and the increased cost of raw material not adding materially to the cost of the goods. In many of these lines there is very active competition, and prices are very low. The coming month is looked forward to with much interest as likely to test the market, and if the prices ruling for Iron are maintained it is probable that the whole market will be characterized by a decidedly better tone.

Advices from Chicago.—Business continues very brisk for the middle of June. Jobbers are having an exceptional demand for all kinds of goods, many of which are not usually sold until later in the season. This is attributed to the advance in price that has been made on special lines, such as Nails, Barb Wire, Sheet Iron, &c., and the probability that before many more weeks have passed manufacturers of all lines of metal goods will make corresponding advances. Jobbers in the last 30 days have held closer to their schedule prices than at any time in the past two years. The whole line of Heavy Hardware is firm, and on some grades of Bolts, Nuts, Washers, &c., inside prices have been withdrawn.

Notes on Prices.

Wire Nails.—New and advanced prices were determined on by the manufacturers who were in session when we went to press last week. These prices, while ostensibly intended for July, went into effect at once, inasmuch as the mills had reached their capacity for June delivery. Two days were occupied in the deliberations of the manufacturers, and several important questions were considered. The following are the prices determined on by the meeting and now in force: Carload lots, or mixed cars, \$1.55 per keg, base, f.o.b. Pittsburgh; less than carload lots, \$1.65 per keg, base, f.o.b. Pittsburgh. On direct shipments on contracts in less than car lots of 24,000 pounds of Nails an extra 5 cents per 100 pounds will be charged. To jobbers taking of one mill within one calendar month 1000 kegs and over 5 cents per keg rebate will be allowed. An advance of about 10 per cent. was also made in the price of miscellaneous Nails. It was decided not to sell to syndicate buyers, and action was also taken to strengthen the position of the associated manufacturers and to secure a general maintenance of prices. Notwithstanding the heavy advance made in prices the demand is active, and it is thought that very soon the leading mills will have sold all the Nails they can turn out in July, when it is expected that the usual shut down for repairs,

&c., will take place. The New York price for small lots of Wire Nails from store is held at \$1.80.

Advices from Chicago.—There is no let up in the demand for Wire Nails. Makers are of the opinion that at the present rate of receiving orders their entire output for July will be sold before the 10th of that month. Manufacturers are not booking orders for delivery earlier than July 1. Jobbers are quoting \$1.75 in any quantity from stock and are doing a large trade.

Cut Nails.—An advance corresponding to that made in Wire Nails has been made by the manufacturers of Cut Nails. The New York prices are as follows: Small lots from store, \$1.60; carload lots on dock, \$1.45; small lots on dock, \$1.56.

Advices from Chicago.—The Cut Nail trade has also felt the influence of higher prices. Manufacturers are well supplied with orders. Jobbers report a light demand and quote \$1.50 to \$1.60 from stock in any quantity.

Barb Wire.—The Barb Wire market continues to be characterized by an excellent tone, with a large volume of business, considering the season of the year. Prices are firm at former quotations.

Advices from Chicago.—The demand for Wire is extra good for the season. Makers say they cannot fill orders for immediate shipment and have advanced their prices. Jobbers' prices seem to vary to suit their respective conditions. Painted is quoted at \$1.85 to \$2 and Galvanized at \$2 to \$2.35, thus making the range abnormal wide on small lots.

Fittings.—The principal manufacturers of Valves and Fittings for water, steam and gas have been in session a number of times recently for the purpose of revising many of the lists on this line of goods. It is not with a view to raising or lowering prices that this is being done, as that can be effected by changing discounts, but for the purpose of replacing antiquated and disproportionate lists that now bear little relation to cost. Improved methods of manufacture, together with changes in the cost of materials, labor, &c., have contributed mainly to the discrepancies that now exist and make it necessary to have a multiplicity of discounts where fewer would be sufficient and give greater accuracy and simplify business. It is believed this effort will meet the approbation of the trade.

Binder Twine.—There is little change in the condition of the Binder Twine market since our last reference to it. The market is represented by the following quotations:

	Per pound.	Cents.
Sisal.....	4 1/4	
Standard.....	4 1/4	
Manila.....	5 1/2	
Pure Manila.....	6 1/4	

Wrought Iron Pipe.—Notwithstanding the fact that there have been within a short time several advances on Wrought Iron Pipe, the market is still characterized by a firm tone and has an upward tendency. The present prices represent the market for ordinary lots:

	Per cent.
1 1/4 inches and under, Plain, .62 and 10 and 5	
1 1/4 inches and under, Galvanized.....	.57 and 10 and 5
1 1/2 inches and over, Plain, .70 and 10 and 5	
1 1/2 inches and over, Galvanized.....	.60 and 10 and 5

Corresponding advances have been made in Boiler Tubes and Casing.

Corn Popper.—The Quincy Corn Popper, illustrated in our issue of 22d inst., and put on the market by the Quincy Hardware Mfg. Company,

Quincy, Ill., is sold to the trade at 25 cents each for the No. 1, holding 1 quart, and 35 cents each for the No. 2, holding 2 quarts.

Cordage.—The demand for Rope is good and the market fairly firm. There is, however, some irregularity in the prices named by the different manufacturers. Manila is regularly quoted on a basis of 6 1/4 to 6 1/2 cents and Sisal at about 4 1/2 cents per pound; but these prices are sometimes shaded on large and attractive orders.

Glass.—On or before July 1 all the Window Glass factories will be closed for the summer, and production will cease until September or later. It is estimated that stocks on hand will be sufficient for the requirement of the trade until the factories are again in full blast. There is considerable speculation as to whether Glass will be higher in the fall, and it is understood that speculative buying is being done by jobbers, especially where manufacturers in need of cash can be induced to shade present prices. The shading of prices, however, is reported as extremely rare, the market as a rule being firm. Consumptive demand is fair, and orders have been quite freely placed with jobbers for immediate and future delivery. Discounts adopted May 1 represent present quotations.

Eave Troughs.—Discounts on Eave Troughs have been reduced by jobbers to 70 per cent. off for Galvanized Lap or Lap Joint and 65 per cent. off for Terne Lap or Slip Joint. The discount on Eave Trough Mitres has been correspondingly reduced to 20 per cent. off.

Old Metals.—The market for Old Metals of all descriptions continues good, Copper and Brass Scrap, in particular, being in active request. Scrap Iron moves briskly, and prices are quite firm with an advancing tendency. The following quotations represent dealers' purchasing prices for moderate sized lots, New York City delivery:

Heavy Copper.....	73 1/2¢
Light and mixed Copper.....	71 1/2¢
Heavy Brass.....	5 1/2¢
Light Brass.....	4 1/2¢
Lead.....	3 1/4¢
Tea Lead.....	28 1/2¢
Zinc.....	24 1/2¢
No. 1 Pewter.....	19 1/2¢
No. 2 Pewter.....	18 1/2¢
Wrought Scrap Iron, 1/2 gross ton.....	\$3.75 to \$9.00
Heavy Cast Scrap.....	8.50 to 9.00
Stove Plate Scrap, 1/2 gross ton.....	6.00 to 6.50
Burnt Iron.....	gross ton 5.00

Old Rags, Paper, &c.—The market is fairly brisk for Paper Stock of all kinds, and the outlook is regarded as promising. Prices are very firm in nearly all lines. Dealers purchasing prices, New York City delivery, rule about as follows:

No. 1 White Rags.....	1/3	to	3/4
No. 2 White Rags.....	2 1/2	to	3 1/2
Mixed Rags.....	5/8	to	1
Blues and Sds.....	1	to	1 1/8
Hard Sized White Shavings.....	2 1/2	to	2 3/4
No. 1 White Book Shavings.....	19 1/2	to	21 1/2
No. 2 White Book Shavings.....	13	to	14 1/2
Light Book Shavings.....	1/2	to	5/8
No. 1 Mixed Shavings.....	3/4	to	1
No. 2 Mixed Shavings.....	5/8	to	3/4
No. 1 Printed Books.....	1	to	1 1/4
Ordinary Mixed Books.....	3/4	to	5/8
Newspapers.....	1/2	to	3/4
No. 1 Manila Paper.....	1/2	to	1
No. 2 Manila Paper.....	3/4	to	1 1/2
Bogus Paper.....	1/2	to	3/4
Common Paper.....	1/4	to	3/8
Straw Chips.....	1/2	to	3/4
Binders' Clippings.....	1/2	to	3/4
Gate Butts.....	1 1/2	to	1 3/4
No. 1 Mixed Bagging.....	1	to	1 1/4
Mixed Bagging.....	3/4	to	1
No. 2 Bagging.....	3/4	to	1
Hemp Twine.....	1/2	to	2 1/4
Manila Rope.....	1 1/2	to	2 1/4
Jute Rope.....	1 1/2	to	1 3/4
Mixed Rope.....	1/2	to	3/4

Old Rubber.—The following quotations represent about the current prices paid by New York Dealers:

Car Springs, ton lots, 1/2 lb.....	3 1/4¢
Rubber Shoes, carloads, delivered at factory, 1/2 lb.....	4 1/2¢
Rubber Shoes, less than carloads, 1/2 lb.....	4 1/2¢
White Wringer Rolls, 1/2 lb.....	5 1/2¢
White Syringes, 1/2 lb.....	8 1/2¢
